> Any favourite station computers that do not use 80..*[68] cpu's?

The Amiga is a great computer because the operating system is true multi-tasking. You can use any of the many available terminal emulator programs to talk to the TNC and/or send and receive files. Meanwhile, you can have a separate window running any Amiga word processor to read files that have been received, and prepare files to send. While all this is going on, a third window can send a file to the printer. And another window can be used to run a log book program, and ...

For example, connect to a BBS, request a listing of postings, and send that to a file. Bring up the file in the editor, and look for postings of interest. Use the terminal window to tell the BBS what file you want to read. Meanwhile, the contents of the listing file don't scroll off the screen!

In the 80..*[68] world, you have to buy a special program to attempt to do all this, and you are forced to use whatever editor, etc someone else chose.

I have some questions about packet networks. I am really new to this subject,
but I am very interested in it.

1- Is it possible to use HF for packet communications? And what is the
   current used frequency band? (VHF? Microwave?)

2- What is the current limit on the baud rate that is possible? 9600?

3- Is TCP/IP the best protocol for a radio packet-based network?

4- How efficient is it to have several transmitters transmitting at the same
   time and causing all sorts of collisions?

5- What is a good reference on all of this? Does the ARRL publish any books
   on this topic?

Thank you very much for your help. I'm looking forward to learning more about
packet radio and using it soon.

...or get an operating system that does DOS better than DOS...If you have a
386SX or better, and can get RAM above 4 MB, take a good, long look at OS/2
2.0. You'll be impressed, even if you just want to multitask DOS and Windows
programs (a job that it beats Windows at, hands down).

Sub: Hooking the PK-232 MBX to the TS690S or the TS450S
     and grounding the PK-232 to reduce distortion on SSB
     transmissions.

I would like to take this opportunity to thank everyone who replied to
my question about connecting the PK-232 to the TS690S. I eventually
had to replace Q5 and the PK-232 now keys the 690S. In particular, I
would like to thank Dick (KD5VU) and Erich (KA6AMD) for their input
on how to connect the PK-232 to the 690S and the 450S. The following
information has been edited from that which they had sent me earlier.

1. HOOKUP AND PIN ASSIGNMENTS

Dick uses the ACCY2 port of the 450S to hook up his PK-232 for AFSK operation. The following list details the Pin Assignments which Dick uses for AFSK Operation:

PK-232 J4		TS-450S (ACCY2 PORT)	
Pin 5 RED	PTT	Pin 9	PTT
Pin 4 BROWN	GND	Pin 8	GND (Do not use Pins 4 or 12)
Pin 3 BLACK	-	-	Not Used
Pin 2 WHITE	AFSK-OUT	Pin 11	AFSK-IN
Pin 1 GREEN	AFSK-IN	Pin 3	AFSK-OUT

As Dick indicated to me, it is important to ensure that you do not overdrive the rig. Since neither the 690S or the 450S has a Tx monitor you will need to watch the ALC setting after setting the desired power level and AFSK audio output from the PK-232. Please note that it takes very little Mic Gain to overdrive the ALC. Also - the 450S and the 690S are rated as 100% duty cycle units. I personally felt more comfortable setting the power level to 50 - 75 watts although the 690S manual suggests setting the power level to 100 watts.

++

Erich (KA6AMD) hooked up his 690S to the PK-232 in order to use FSK for digital communications. The hookup he uses works well for him on all the digital modes and is listed below:

PK-232		TS690S (ACCY2)
J7-4	FSK KEYING	2
J4-1	Rx AUDIO	3
J4-4	AUDIO GROUND	4
J7-2	FSK AUDIO	8
J4-5	PTT	9
J4-2	Tx AUDIO	11

On the PK-232 J4 is Radio Port 1. J6 is Radio Port 2. Either port may be used.

2. GROUNDING PROBLEMS

Both Erich and Dick indicated that they had distortion when

transmitting on SSB when the PK-232 was hooked to their rigs.
The Kenwood reps were not able to help them with regards to
the problem. Erich suggested that I Disconnect the PK-232 when
using SSB. Dick also had little luck with the reps, but he was
able to determine that there are floating grounds in the ACCY2
port of the 450S and 690S.

Dick appears to have corrected this problem by grounding the
PK-232 to the 450S. As Dick noted (edited :-))(please note that Dick
is using AFSK):

> " Yes! I had the SAME problem (I called it distorted xmit audio) and
> the GROUNDING fixed the problem. Its history and the rig works now
> with the PK-232 hooked up via the ACCY2 plug. The fine print
> in the (Ken)wood manual says you have to GROUND the rig. You better
> ground it as they have some floating grounds.
>
>
> I grounded the PK-232 to the Kenwood TS-450S/AT two ways:
>
>   - Used the single pin 8 in the ACCY2 plug to the Gnd connector
>   on the PK-232 (the white molex plug). Note I did not [repeat
>   did not] used pins 4 & 12 as shown in the TS-450S manual.
>
>   - The winner was to ground the PK-232 from the circuit board (used
>   one of the screws that supports the mounting foot nearest the
>   DC imput connector) to the Large Ground Lug on the rear of the
>   TS-450S.
>
>
> Kenwood has some floating grounds in the ACCY2 port and will not
> admit to the problem.
>
> Without the REAL ground wire PK-232 to TS-450S my SSB audio was
> big time screwed up when the ACCY2 plug was attache. "

     I have set my rig up for AFSK operation and I have grounded my
TS690S as Dick has suggested. I have not yet had problems with
my audio when transmitting on SSB.

Once again - Thanks to all who replied. And as Erich noted earlier:

ANYTHING YOU TRY WITH YOUR TNC (PK-232) AND YOUR RADIOS IS YOUR
RESPONSIBILITY.

A friend just loaned me a Heathkit TNC HD-4040 with no cables and no
manual. It has KISS proms in it and I have the latest NOS I could find.
Now I just need to make a cable from the DB-9 on the TNC to the radio.

I am just getting started in packet. And I'm on vacation for a week.
(But, I will be checking my e-mail regularly and newsgroups when I can.)

Thanks.

North West Packet User Group, (NWPUG) sell a set of Node/BBS maps that
cover the UK. The UK is split into two A3 sheets, and the set costs
1 pound. We (NWPUG) attend most of the rallies in the North West.

If you cannot attend the rallies in our area, then you could order
them through me.

John.

 They're also not TNC2 clones in that the EPROMS aren't compatible,
the command set differs, and I wouldn't be at all surprised if the
hardware is considerably different. They don't use the 2206/2211
chipset, and cannot be run open-squelch (very important if you want
better than mediocre performance) without adding a DCD state
machine like true TNC2 clones can.

 To stop a rumour in the making, yes you _can_ use 9600 baud modems
with them, but as you (correctly) point out, you "can't plug ... 9600
baud modems ... into them", i.e. inside. (Even if they had an
internal header, there's physically no room). They have to be
externally mounted, and the PK88 must be slightly modified (cut a
trace and tack a wire) to bring out a x16 clock. AEA, in their
infinite wisdom, brought out a 9600 Hz (x1) clock. All other
necessary modem connections are brought out through the DB25.

> They are, however, a cheap way into packet. Reliable.

 Yes - and so are the true TNC2 clones.

Yes, *possible*, but not pleasant, due to the fact that the mac is
a machine with cooperative multitasking and except on the most expensive
models, the CPU is involved in every byte of every disk transfer.
[DMA? What's that?]

>| Department of Electrical Engineering and Computer Engineering |

Jim, I hope your PhD thesis isn't on the difference between
preemptive multitasking and cooperative multitasking.

I'm trying to put together some pretty pictures to describe the packet
network we're building. I know there are some commercial programs that
allegedly are designed to draw network maps, but they're a bit pricey
for a one-shot hobbyist deal. Anyone know of a similar shareware or
freeware program?

I know almost nothing about radio, packet or otherwise.
At Apple, we have a service that gives us stock quotes,
which we receive over a radio.
What kind of service is this ? Does it cost money?
I have seen things like silent radio at the post office,
Are there other services like this?
How can I buy that service?
maybe news feeds, weather feeds, anything?
I would like to hook it up to a mac.
What kind of hardware do I have to buy to receive this?
where do I go to buy It?

Here we go again... Try 2. An attempt was made to get this exact same
argument started over on the tcp-group. Sorry, but it won't wash here
either. First, we have far too many better things to do with our time.
Second, both forms of multitasking have their place. I will still
maintain that for data comm systems, or for that matter just about any
real time system, I would much rather have a non-preemptive system. When
you begin to realize that state machine programming solves many real-time
problems extremely well, you might begin to understand why it's better
not to have what you are doing interrupted by an OS doesn't know any
better.

Now we all know that each computer has a specific task that it solves
quite nicely for its user. Obviously you like the Amiga an awful lot.
That's fine. Others happen to like Macs, and still others DOS based
PCs. There are probably even a few CP/M users around. This group is
meant for discussing ham packet radio topics. Shall we keep it that
way?

Or do you really want me to point out that my Mac was the first computer
to drive the 56K packet modem at true 56K???

Alinco mods to use mic connector for 9600 baud data

TRANSMITTER

Remove R31
Remove C40 and replace with one end free and other end
reconnected to pin 7 of the VCO board. Connect a jumper between
the now free end of C40 and the hot end of C35. The Mic input is
now connected directly to the VCO.

RECEIVER

Disconnect the pink wire that goes to data output on the
mic connector from the PCB and reconnect it to pin 2 of the IF
board connector. This eliminates the low pass filtering on the
discriminator.

Does anyone know where I can get the latest version of the AA4RE BBS code? I
am on a local packet committee and they are thinking of switching BBS software
so I wanted to get a look at several different packages. If possible you could
answer me here as I am linked from FidoNet into this one and not sure if the
mail can cross over very well or not.

I am looking also for thoughts and ideas on different pieces of software and
which has the most speed and efficiency on a channel.

Your thoughts are appreciated.

I've looked all over the local PBBS's and I can't seem
to locate the following information: a list of types at statuses.

I can figure out that PN means "Personal, Not Read" and
"B" is for Bulletin and "T" is for traffic, but what does
the "$" status mean, the "F" status, etc?

     Thanks!
        John

>chipset, and cannot be run open-squelch (very important if you want
>better than mediocre performance) without adding a DCD state
>machine like true TNC2 clones can.

  Both the TNC-2 and the PK-88 use a Z-80 processor. The TNC-2 uses a Z-80 SIO chip, and the PK-88 uses a Z-80 SCC chip. The TNC-2 uses a state machine ROM for recovery of clock in the incoming data; the PK-88 uses the digital PLL internal to the Z-80 SCC. Digitally, they're quite similar but not the same.

  As for the modem, the TNC-2 uses the Exar analog 2206/2211 chips while the PK-88 uses the Am7910 "World Chip". The 2206/2211 modem is tuned by a combination of resistors and capacitors; it may require re-alignment from time to time. As Mike points out, the 2211 demodulator does indeed provide a "Lock Detect" signal which can be used a DCD indication. Since the modem is tuned by resistors, it is not easy to change the tones in use, for example, when switching from 1200 baud to 300 baud. I recall the TNC-2 provides a method to make this a little easier by mounting the tuning resistors on a DIP header.

  The Am7910 in the PK-88 is a DSP telephone modem; the Carrier Detect output simply indicates the presence of any noise on the channel over a preset level. It cannot be used as a DCD indication. The Am7910 is tuned by a crystal fixed at 2.4576Mhz (in the PK-88, this clock is derived from the 4.9152 Mhz Z-80 clock). The PK-88 allows the switching of modem tones from the TNC command line. Adding a TAPR DCD State Machine to the PK-88 is quite easy; it took less than an hour to build and install the kit in my PK-88.

  Research indicates the Am7910 is superior to the XR2211 demodulator with respect to the Signal-Noise ratio. A paper published in the Sixth(?) ARRL CNC suggests a 12dB difference in required SNR between the two chips, but I recall the XR2211 implementation used in that research was flawed; my guess is the XR2211 implementation in the TNC-2 is probably requires 2-3 dB better SNR for the same error rate as the Am7910 (if someone has a copy of the K9NG article on the TNC-2 modem error rate, I'd like a copy)

  Given the superior performance of the Am7910, ease of control, and precise frequency control, I'd select the PK-88 with the TAPR DCD State Machine any day over the TNC-2 for 300 or 1200 baud operation. If you are going to use an external modem, the two are essentially equal.

P.S. I recently purchased a few of the SSI 73K302L modems; these are low power, single +5V supply Bell 212A/103/202 modems. They require 35mW @ 5V and are specified at rather impressive SNR performance; once I get one working, I'll report the results.

Subject: macintosh packet softkiss v1.1.t
Lines: 15

Softkiss version 1.1.t connects a modem directly to a macintosh. This saves
having a TNC. Softkiss will work with 300 baud HF, 1200 baud VHF and
higher baudrates. The software is functional at this time but the user
interface
is not pleasent yet.

Softkiss is available akutaktak.andrew.cmu.edu [128.2.35.1] in
/aw0g/softkiss.1.1t.sit.hqx. You also need Phil Karn's Net/Mac program
if you don't have it, it is available as /aw0g/netmac22.sit.hqx

Changes since the last release: Well it acutally works. I connected
to my local packet bbs for a couple of hours last night. There is
more of a manual on how to hook it up.

BALONEY!

While I'm reading your message, I've also got three other applications
running: downloading from CIS, running MPW and editing a list of files,
and of course I have the Finder. There's nothing unpleasant about it.

> ...due to the fact that the mac is
> a machine with cooperative multitasking and except on the most expensive
> models, the CPU is involved in every byte of every disk transfer.

So? That has nothing to do with multitasking.

> [DMA? What's that?]

Direct memory access. It permits the CPU of a machine to perform other tasks
while transferring data into or out of main memory.

(Note that all 386 and 386sx machines have DMA. Note that none of them use it
for hard disk i/o because it is too slow)

--

Andrew, you clearly have not used a Macintosh for multitasking and shouldn't
be posting such untruths to the net. Cooperative or not, it is still
multitasking.

One gotcha, at least with my PK-88 (close to two years old, now): In KISS mode,
it does not accept a packet longer than 1K. I don't know if AEA has fixed this
one in later releases. On my local network, where 4-5K packets aren't uncommon,
this got in the way a bit... It doesn't blow up or anything; it simply drops
the packet on the floor.

True, the Macintosh does use cooperative multitasking. But you see, with
well written applications, the user never feels the difference. In fact
the application can use cooperative multitasking to its advantage in that
it knows EXACTLY when it's being swapped out.

>>| Department of Electrical Engineering and Computer Engineering |

>Jim, I hope your PhD thesis isn't on the difference between
>preemptive multitasking and cooperative multitasking.

For what do I deserve such a flame?   I was simply stating a fact. All
of your examples were and are possible on the Mac. I never said that it
used pre-emptive multitasking. Don't you have anything better to do with
your time than to flame people? Get a clue.

I am not particularly fond of the Mac. But I have to give credit where
it is due when it comes to Apple's anti-EMI design. I'm impressed.

For various reasons, however, many hams use PCs, so the Mac's good EMI
design doesn't do them much good. Does anyone have any experiences
with the better designed PC cases, e.g., the rack mount "industrial"
chassis? They do look like they should be much better tighter than
the usual desktop or tower cases.

As for cooperative vs pre-emptive multitasking, they each have their
place. I use the former in my NOS code, but it is much less
satisfaactory in a general purpose operating system. I do get tired of
individual applications in multitasking systems that crash the entire
machine when they fail...

Subject: AA4RE V2.12 - PK-88 Lockup Problem
I am experiencing problems with AA4RE V2.12 locking/hanging up when a User
connected and downloading either ASCII or Binary files subsequently crashes.
It would appear that the User is polled until timeout occurs at which point
the TNC drops the CON state, however the BBS still shows the connect as
active. I believe the TNC TX buffer is now full and although it will accept
further connects, the BBS is unable to transmit to the TNC. Immediate cmds
TC and RT appear to have no effect, the only solution being a system restart.
Configuration is an XT 4.7MHz working 4800 to the TNC. The PK-88 has EPROM
release 01 JUN 90. Any solutions greatfully appreciated by myself and others
experiencing similar problems.

Hi all -

I'm playing around with a Baycom modem & the 1.4e Software - I'd like
to find out a few things which did not get explained in the manual.

* Monitor Display - What are all the codes displayed.
  Most of them correspond directly to the AX.25 spec, but
  some of them are unknown to me. Does anybody have a
  summary of these codes and what they represent?

* How does one support a YAPP transfer under the using
  the Baycom setup? If not, then are the srcs available for
  modification as long as it is feed back to the authors?
  If not, I suppose one could use the PMP software with the
  Baycom modem (same basic hw theory).

* Are there alternative Software solutions to using the
  Baycom SW directly?

* Is there a Mailbox mode available?

Thanks,

Terry Domae

The following is the first draft of common packet software
dates and versions. There are errors, oversights, and
omissions. Comments and corrections are welcome.
The dates and versions are accurate as of the date below.
During the month it took to accumulate the list, half the
packages were updated. The next release will include
commercial tnc firmware revisions and commercial packet
software revs.

@(#) Packet Software Versions. Fri Jun 12 00:45:53 PDT 1992
Official releases only, no Beta versions.

Software is for MSDOS unless otherwise specified

I just got a PK-232MBX TNC the other day. So far I've just been tinkering
around with some local BBS's, but what I'd really like to do it get into
TCP/IP. For now, the only thing I can run NOS on is my HP95LX palmtop
computer. I've obtained the version of NOS compiled for this computer,
as well as the reference guide and the Beginner's Guide to TCP/IP.

I used the latter document to setup an autoexec.net file (at least a first
cut at it), but I'm stuck when it comes to getting my TNC into KISS mode.
There are specific instructions in the Beginner's Guide for setting
up the PK-232, but I'm having trouble with them. The Guide lists the
following sequence of commands:

```
START 0
STOP 0
XON -
XOFF -
XFLOW OFF
CONMODE TRANS
HPOLL OFF
KISS ON
RAWHDLC ON
PPERSIST ON
HOST ON
```

The trouble is, after entering the KISS ON command, my TNC will refuse
to accept any more commands until I break out by hitting control-C three
times. At that point the value of KISS is $00 (i.e. off). My first thought
was to move that command to the end of the list, but the HOST ON command does
the same thing. There doesn't appear to be any way to get all of the
commands in.

Just for fun, I tried running NOS without entering the last 3 commands,
just leaving the TNC where it was after I typed KISS ON. I could ping,
telnet, ftp etc. to *myself* but trying any other address caused NOS
to hang (or just keep trying indefinitely). When I was in my terminal program,
keystrokes caused the STA light to flicker, but there was no flickering
when I tried to connect from within NOS. Typing "tip ax0" in NOS and
then typing on the keyboard *did* cause the light to flicker.

I'm pretty sure my TNC isn't set up correctly for NOS, and because of that
I don't know whether NOS is set up correctly. Can anyone help? Also,
is anyone familiar with the TCP/IP activity in the Seattle, WA area,

especially with respect to what frequencies are used for TCP/IP traffic?

Thanks in advance,

--

Those last two lines should be
XON 0
XOFF 0

It was a typo when composing the article. I got it right when I was configuring
the TNC.

This is in reply to Bob's (eanc-ra@taegu-emh1.army.mil) question: "[How do] I
... do packet at 9600 baud."

First: whoever told you that you need a modem to do packet radio is not
completely correct. You need a modem capable of sending at 9600 baud if your
TNC is incapable. From reading your post, you already have a TNC. Is it
capable of sending at 9600 baud. Because of bandwidth limitations, you are
only going to be able to send reliable packets at 300 baud on HF, and 1200
baud at VHF. If you are going to choose another medium such as telephone or
microwave or via satalite, where you have greater bandwidth, then you will
have no problem with 9600 or greater baud rates.

The speed at which your computer will talk to your TNC or modem, is dependent
upon the CPU speed of the computer. If you are using an older 8088 IBM
clone, don't expect to use anything greater than 2400 baud. If you are using
a 286 class machine, depending on the speed of the CPU, you can go as high as
9600, and with most 386 (and higher) machines, you should have no problems at
9600 baud or possibly a little higher.

I use packet to link up to the Franklin Radio Club's DX cluster. This is
good for dx spotting, and helps you to locate the countries that you need.
This won't help you work the station, but it takes the pain of locating the
rare one out of the task.

In regards publish more BBS specs, here is what I believe is the
current header spec.

Header spec -- Originally from NK6K

Required items
  1) Receive time
  2) BBS call
  3) Message number

Receive time
  1) Must start in first position.
  2) Time zone optional at end (1 character)
  3) Format: R:yymmdd/hhmmz

BBS call and message number
  1) Two formats permitted (the W0RLI standard and the WA7MBL standard)
       "nnnnn@bbbbbbb" and "@:bbbbb #:nnnn"
  2) The callsign was later extended to include the hierarchical address.
  3) Everything after the bbs callsign to the next field start is
     ignored.

Optional items
   1) General format of "f:dddddd" where f=field identifier and
      dddddd is the data.
   2) Field identifiers in general use:
         $: for bid
         O: for originating station. Was needed way back when some
            old BBS code dropped this data
         Z: for zip code. Zip codes preceded hierarchical addressing.
            There was some effort to standardize on routing using these
            but along came hierarchical and the effort died.
         S: Sent time

Gee, and I got it in writing, too. <grin>

> As for cooperative vs pre-emptive multitasking, they each have their
> place. [....] I do get tired of
> individual applications in multitasking systems that crash the entire
> machine when they fail...

Actually, the latter aspect (of crashing the system when an application
crashes) has NOTHING to do with cooperative vs preemptive multitasking.
It has more to do with memory protection and proper system resource
management. Either can exist in a cooperative or preemptive multitasking
system.

For the record, Apple's System 7 is much better about keeping the
system alive when an application crashes. System errors will terminate
that application, leaving the others running. Of course, if certain
system resources are corrupted in the process, the entire system can
lock up, but that just doesn't happen very often.

TAPR's instructions for new 9600 modem include wiring for pk88,tnc-2/clone
and pk232, seems to be a simple hook up.

I have an Azden PCS-2000 2 meter FM rig that I would like to use for
packet radio. The microphone connector is a 12 pin type that is
unavailable from either Radio Shack or the local electronics supply
house. The 12 pins in the connector are arranged in three rows of four
each. I called the Azden dealer in Georgia, but they no longer have any
connectors or microphone cables with connectors in stock. The
operator's manual is very little help. It lists p/n EC-80 which is the
cable with connector, but no part number or manufacturer for the
connector. Amateur Wholesale Electronics was the only source of parts
listed in manual I have. Does anyone on the net know where I could
obtain the female mic connector, cable with connector or even the whole
microphone for this rig?

This isn't true. It has been shown that a 9600 baud packet signal
generated by a K9NG/G3RUH modem fits within the legal bandwidth
requirements on 2M. At 220 and 440 MHz, speeds up to 56KB are legal and
possible.

Most TNCs can hack 9600 baud packet, though some may have trouble unless
you increase the clock speed (often a matter of moving a jumper, and
maybe putting in a couple of faster chips). The 9600 baud modem can
sometimes be mounted internally, or if space doesn't allow can be
external to the modem. But in any event, you will not be able to use
the TNC's internal modem.

>The speed at which your computer will talk to your TNC or modem, is dependent

>9600 baud or possibly a little higher.

I have seen an XT machine running at 56KB, but admittedly that was with
a special plug-in card that took the place of a TNC. But an XT <can> run
at 9600 baud on the serial line with most terminal programs that do
interrupt-driven instead of polled asynchronous communication. And, by
using a $15 replacement chip on the serial card (a 16550AFN), an XT can
run easily at 19.2KB on the serial port.

I run a 286 with the 16550 chip at 38.4KB with no trouble, using the
KA9Q NOS software.

Ideally, you'd like the computer-to-TNC link to run at a higher speed
than the radio link, so 19.2 is nice for a 9600 baud system.

Why would anybody load up 30mb worth of OS just to run amateur radio?
Easy! I don't just want to run amateur radio! I want to use it for other
things at the same time - and OS/2 is *superb* at that.

I'm running the WG7J variant of the KA9Q NOS tcpip program for amateur
radio in a dos session. I'm using an Ottawa PI hdlc interface card (instead
of a TNC) to drive a 56Kbps radio channel. For more info on OS/2 2.0
and NOS, telnet jks@giskard.uthscsa.edu, and read the FAQ messages
in the area OS2_FAQ.

Cheers (and 73),
Dave

Forsale $250.00   40 for tower

I have a 40 foot tubular steel tower for sale. It is professionally refinished
and looks brand new. Tower was sand blasted clean, primed with industrial zinc
chromate, and top coated with tower gray enamel.

Tower has tilt over base mount and requires a 2 by 2 by 4 foot concrete base. The
tower is 12 inches on aside, and would require bracketing to a house or guying to
insure stability (like any typical tower). It is similar in dimension to a RHON
20 or 25 model.

The tower is in great shape and requires no clean-up. Don't miss this bargin!!

Call during the day or leave message for Greg at 201-896-7475.

Hello:

I am new to the list as well as new to packet radio. I would like your
help on the following:

I have connected a PK88 to my PC and am running PACKRATT II software.
So far I have had pretty good success at making connections. Now I
would like to attempt implementing TCP/IP.

I understand that one can run TCP/IP. I would like to know exactly what
is required to do this (if in fact it is possible on a PK88)...

for instance:

1. Does the PK88 support TCP/IP usage?
2. Where do you get TCP/IP?
   - Does it include FTP, TELNET, TN3270?
3. What configuration is required on the PK88 and the PC?
4. What else is required (ex: min dos version...)?
5. What is KISS mode?
6. I have heard that you must be in "KISS MODE" to run
   TCP/IP, is this correct?
7. Also, *am* I currently able to connect to net/rom nodes and then
   from there connect via TCP/IP to other locations?
   - If so what net nodes offer this capability?
8. Are there gateways to the internet?
   - If so what are they?

I appreciate any help I can get.

RLMeyering (KD6AUK)

I strongly disagree. OS/2 would make a fine operating system for
amateur radio applications. True multitasking should prove extremely
valuable to amateur radio operators.

The entire extent of my knowledge with respect to amateur radio
applications is that KA9Q/NOS is available in an OS/2 version (with
partial PM support). It presently operates only with SLIP, but that's
fine for amateur radio. It looks like an interesting package. You
can obtain it via anonymous ftp from ftp-os2.nmsu.edu, directory
pub/downloads/tcpip (though that is subject to change).

Several people are running my BBS program under OS/2 with good
results. Frees the computer to do other things. I do all the main
development under OS/2. I also run TCP/IP on OS2 (not NOS) but await
a true interface (like NDIS) to AX25 that any TCP/IP can use.

Hi net-ers

Do you know any source for the "89024" 2400 BPS Intelligent Modem Chip Set
(it is INTEL and consists from two chips : P89027 and N89026).
Intel does not sell to individuals.
I prefer a source in USA.
I will appreciated e-mail answer.

Thanks

I have built the BAYCOM modem using a TCM3105 .
I put it inside a D25-D25 adaptor connector without using a board.
The most important modifications is to add a back to back pair of 1N4148
(or similar) in parell with the R9. So it protects the TCM3105 from strong
audio signals from the speaker that may distroy the chip.
Also there is an error in the schimatic.
There is also an typo error . Between D2 and IC2C the resistor is R3 (not R2).
It is 2.2 Kom.
The most importand : it works great !
Both software and hardware are great.
Also exept BAYCOM exist TFPCX & SP 6 (a baycom & pmp driver for super packet)
and ax25drv a FTP driver for tcpip.
73 de

%%%

an external modem.

Where can I get in touch with the manufacturers of a suitable external modem?
I am in the UK; I guess that the G6RUH(?) modem would be good if only because
the designer will be within reasonably easy access. Or does anyone have any
better suggestions?

Thanks,
/Alan

The reason is that you have a PK-232MBX while the instructions are for
a PK-232. The ROM has changed. Now all you have to do is type KISS ON
and the PK-232MBX will go into kiss mode with default parameeters that
will work with NOS. Read the PK-232MBX manual.

>Just for fun, I tried running NOS without entering the last 3 commands,

This is a *different* problem. NOS has changed since the doc was written.
If you are using other than a 3 wire connection between the computer and
the TNC, IE SD, RD, Gnd, then you must assert DTR ON in the autoexec.nos
startup file. I don't have my notes handy, but it's a param command. Or,
do what I did and just change to a three wire cable.

With everybody updating their firmware and software faster than the
docs, these problems are inevitable.

A few corrections. You *have* to have a 9600 baud modem to do 9600 baud packet. (For the picky, you can use direct FM FSK with a Kantronics DVR but you won't be compatible with anyone else.) You don't *have* to have a TNC, there are plugin cards for the PC that do away with that necessity. The low baudrate at HF is partially the result of regulation and partially because of HF multipath fading. Faster transfer rates are possible, see Clover II. 9600 is both legal and possible at VHF and above. It works fine on 2 meters. Modems from PacComm, TAPR, G3RUH, K9NG, and Kantronics are all available and interoperable.

The preferred TNC, if you use a TNC instead of a plugin card like the Gracillis or Ottawa PI, is an original or clone TAPR TNC2. Examples include the MFJ1270, MFJ1274, PacComm Tiny 2, and others. *Some* of these TNCs need a slight modification to work at 9600 baud. The opamp used for RS232 in the MFJ and TAPR units needs to be swapped for a TL084, a faster direct plugin chip. The Tiny 2 needs a trace cut and jumper to bring out the high speed serial clock. New Kantronics TNCs support only their 9600 baud modem unless you want to do a lot of hacking, but their modem works fine.

>The speed at which your computer will talk to your TNC or modem, is dependent
>upon the CPU speed of the computer. If you are using an older 8088 IBM

>a 286 class machine, depending on the speed of the CPU, you can go as high as
>9600, and with most 386 (and higher) machines, you should have no problems at
>9600 baud or possibly a little higher.

This is completely false. An original IBM PC can do 9600, or 19.2 kbaud with a suitable interface card. If you are using an async port to talk to a TNC, you must change the serial chip to a 16550AFN. If you are using a Gracillis card, the DMA transfer method it uses works fine as is. Indeed, the Gracillis card will work at 56 kilobaud, as will the Ottawa PI card. The PC is not processor bound, after all the TNC does it with a little Z80. The problem is IO interrupt latency on the IBM bus. That's cured by the DMA approach or the 16 byte FIFO in the 16550 chip. This bus latency is a problem with *all* IBM PCs and clones no matter what processor or clock rate they run since the bus is maintained at a constant 8 MHz for compatibility. (Some clones do run the bus at 11 MHz, but they won't work with all IBM cards.)

Why on earth would anyone put 30 MB of operating system on a computer to use amateur radio. We have been a beta site for 2.0 for quite some time and still can make needed parts of it work, esp. TCP/IP.

I upload in /pub/hamradio/packet/incoming at ucsd.edu the pac48.zip file.
It permits to a ZX SPECTRUM to be used as a packet terminal.
I have not try it. It was copied from @EU packet as a 7pl file.
Good luck.

|> system.

Sure it does. A crash-proof system requires all of those features

(preemptive scheduling, memory protection and resource management).
If I had only the latter two and my application goes into a tight
loop, everything stops. That's as good as a crash in my book.

Like I said, all of those features have their place. I recently bought
a copy of OS/2 because of its claimed ability to fully protect tasks
from each other, i.e., to avoid having to reboot the whole machine
when one application crashes. (I'll install it once I free up enough
disk space!!)

Full protection can be useful even if you're only running one
application. When you develop software on a machine with a $#@!!
Future Domain SCSI controller that takes the better part of an eon to
read the life history of every device on the bus at boot time, you get
real tired of hitting reset all the time...

Mea culpa. Yes, you need to add the parameters

param ax0 rts 1
param ax0 dtr 1

to your autoexec.net file anywhere after the attach command if your
TNC cares about the state of the RTS or DTR leads. And PK-232s *do*
care, as they use them for flow control. And if you want the PC to
obey the PK-232's flow control requests, add the 'c' parameter to the
end of the attach line, e.g.,

attach asy 0x3f8 4 slip com1 1500 1500 115200 c

BTW, NOS saves and restores modem control signals. That is, if they're
down when NOS starts and you raise them with the param commands, they'll
drop again when you exit NOS.

In article <1992Jun27.022249.1345@NCoast.ORG>, allbery@NCoast.ORG (Brandon S.
Allbery KF8NH) asks about sharing com port IRQs:
|> Is there anything that can be done about this, short of surgery on NOS's asy
|> driver? I've been trying to avoid that because the local group runs a
|> customized split-screen NOS and the author won't distribute the source to his
|> changes. On the other hand, I have some ideas of my own for it and therefore
|> might go ahead and hack the sources myself anyway.

I performed the surgery in question several months ago on my base

version of NOS. You can now specify "chaining" of IRQs; that is, a device driver can be told to first service its interrupt and then jump to the vector that was in place before the device was attached instead of returning directly from the interrupt. If your hardware is properly designed (i.e., the interrupt request lines are ORed together instead of fighting directly for control of the bus IRQ line) this allows any number of devices to share a single IRQ line.

Although the BIOS ROMs and/or DOS seem to be careful to install null interrupt handlers for each vector at boot time, I didn't want to rely on this. Also, it takes time to call even a null interrupt service routine, so this chaining behavior is NOT the default. To invoke chaining, you have to append the letter "c" to the IRQ number on the attach line in autoexec.net, e.g.,

attach asy 0x3f8 4c slip com1 1500 1500 115200

This tells the attach command to install the link to the interrupt handler that was previously using IRQ 4. The device that is attached last therefore gets control first when the interrupt comes, so keep this in mind if you have devices of different speeds sharing an IRQ.

Shame on the guy who won't release the source to his NOS enhancements. Perhaps a GNU-style copyleft for amateur use would be appropriate...

|> I run a 286 with the 16550 chip at 38.4KB with no trouble, using the
|> KA9Q NOS software.

Recently I had the pleasure of testing a pair of Codex "V.fast" dialup modems. 24,000 bits/s on the line, up to 115,200 bits/sec (!) on the DTE interface. (A standard PC serial port can't go any faster than that, as it corresponds to a baud rate generator divisor of 1!)

And they work, too, even on my 12 MHz 80286-based dedicated packet switch. But the 16550A's are absolutely essential. NOS's FIFO high water mark typically hits 13 when the DTE speed is set to 115,200 and I do a FTP "get" operation. That means an interrupt response time of about 9 character times at 115,200 bits/sec (the chip is set to interrupt when it gets 4 characters.) A standard 8250 or 16450 chip would be hopeless here.

On rare occasions the high water mark hits 17, possibly because of a long interrupt response time caused by being inside MS-DOS. Since the FIFO is only 16 characters deep, I assume this can happen when a character comes in after I've already started emptying the FIFO. I've not seen *any* overruns, though.

Hello:
 I have seen referances in this and other areas about the fact that MSYS is supposed to not work properly when it come's to it's handling of ax.25 and or netrom. My question is,

 1. What really is broke and what symptoms exist on the air to prove that it is bad ?
 2. Is there a particular set of circumstancses that can be repeated that make's it go bad ?
 3. I see some strange things when my g8bpq switch trys to talk to MSYS, but how do I prove that's it's a MSYS internal problem or that it's not just some other problem (configuration or the like)?
 4. Is it all versions of MSYS, or has it been fixed in some versions.

I have been experiencing a problem with the remote mailbox feature of KA9Q NOS V920603. Quite simply, it does not seem to work. After receiving a remote telnet session and receiving a valid login/password sequence, NET displays the mailbox greeting, motd, but then locks up and sens no more data. No prompt, no menu, nothing. The AX.25 mailbox is even worse: after receiving a remote connect, NET sends absolutely no data to the distant station. Manuals I have refer to and "mbox on" command, but this version of NET chokes on it (i.e. returns the equivalent of a syntax error.). Outbound AX.25 connects work fine, and as far as I know telnet seems to be working ok. Any help at all would be appreciated.
Thanks,

The KPC II doesn't have the TAPR disconnect interface that most of the 9600 baud modems are designed to use. The Kantronics 9600 baud unit I have is a daughter board designed to go in the DE56, or as in my case, to attach to a Gracillis internal card. I don't know if a 9600 baud modem is available for the KPC II from Kantronics. I suspect that considerable hacking would be required to fit one of the other modems to the KPC II. Since Kantronics went their own way in TNC design, it's sort of like trying to hack a Mac to take an IBM accessory board to get the TAPR compatible modems to work. You can probably do it, but it's likely much easier to just get a TAPR compatible TNC in the first place. G3RUH's work is the basis for most of the 9600 baud modems. Some are slightly better, and some are much worse. Kantronics' own 9600 baud design is a derivative of the G3RUH design.

+---------------
| I have seen referances in this and other areas about the fact that
| MSYS is supposed to not work properly when it come's to it's
| handling of ax.25 and or netrom. My question is,
+---------------

MSYS has bugs in its NET/ROM and IP handling. I have seen AX.25 problems in the past, but recent versions appear to have fixed them (after all, it's far more likely run into those).

I haven't seen any symptoms in current versions, mainly because I hang out on the IP frequencies these days and all the local MSYSes are on standard AX.25 / NET/ROM frequencies.

NET/ROM: the symptom I've seen is that it scotches packet flow control.

IP: the ones I've seen are:
    - flow control, as with NET/ROM
    - occasional-to-often checksum problems
    - there is at least one known case of a TCP packet with binary data
      (specifically, an LZ-compressed SMTP packet sent by a WNOS node)
      causing MSYS to crash

NET/ROM is best handled with MSYS by attaching a TNC with the NET/ROM, TheNET, or other firmware to it (because NRS *does* work). IP is best avoided.

NOS doesn't support shared interrupts. You should perform a bit of
surgery on your async card and grab an unused interrupt vector, the
LPT vector is a good candidate because DOS doesn't use the parallel
interrupt.

Isn't the common uucico replacement NNTP in the Internet community? I believe
that the NNTP sources have been used on other then u*ix OS's, and also recall
a version written in perl (perl is available on DOS, amiga and others).

NNTP-Posting-Host: ucsd.edu

At the simplest level, most mail and news systems just transport a file
from machine A to machine B, then use the file as input to a program run
on the remote machine. UUCP's remote execution capability was (and is)
used for this purpose in uucp-based news and mail transfer.

In the ham BBS world, the file is sent by imitating a human user typing
over an open connection, with a slightly-formalized message structure.
What to do with the message is specified by the first line of the file
to be sent.

NNTP and SMTP (the internet news and mail protocols) use a dedicated
socket to feed the data over, so it's not necessary to have to specify
what to do with the data - the socket chosen implies what the file is
for, so dedicated programs can handle them.

Thus ANY file transport mechanism can be used to carry news and mail.
However, the current Ham BBS method is too crude for really flexible
handling as Usenet does; it would have to change a bit. But there's
no reason why the command line, instead of being 'SB .....' to transfer
a message, couldn't instead be 'RNEWS messageid' and go from there.

But that begs the entire question of environment: radio is inherently
a broadcast medium. It's silly and inefficient to keep sending the same
message individually to each person who wants to read it. That
inefficiency was why we invented NNTP to replace Internet mailing
lists. We should find a way for a broadcast technology to replace ham

BBSs.

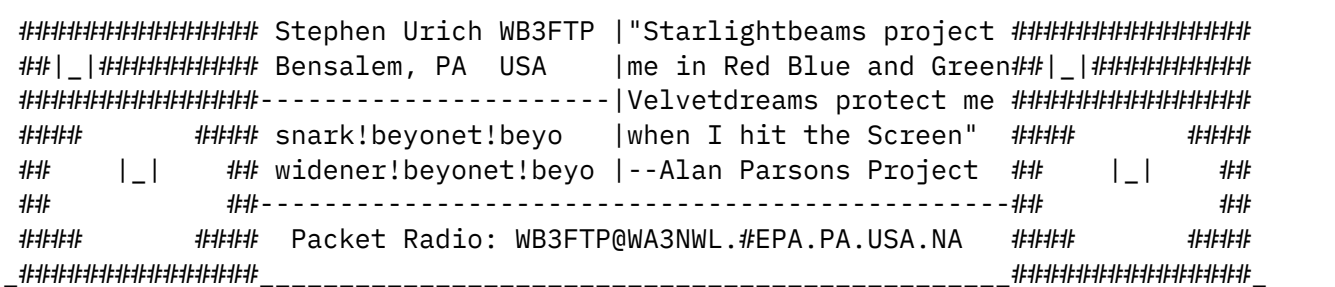
Attention East coast hams. Looking for hams interested in
acquiring and maintaining a repeater link from New Jersey to Flordia,
using 6 meters as a backbone.

Will need sites of at least 100' in height that can have two horizonal
6 element beams installed. One south and one north. Sites need to be
between 100 to 200 miles apart, depending on sites.



This is a serious project that can be done inexpensively.

If interested please contact WR2M Days   (201)584-1550

>f the traffic and free up the airwaves for more packet activity.

When we formed GRAPES, one of the first things we addressed was the coordination of LANS. Actually they are MANS, but the name has stuck. Anyway, we quickly decided that users didn't belong on the trunk frequency playing BBS DXer. It caused unbelievable congestion that held off some sites for minutes at a time while providing little throughput.

What we did was divide the state into RF regions called LANS. These weren't simple lines on a map because of terrain. Basically we told users to choose *one* LAN where they wanted to be found and *stay* there. GRAPES would provide gateways to allow access to other users. Each LAN group has a designated mail forwarding BBS that is accessable on the LAN frequency and that has a second port on the trunk frequency. This keeps BBS to BBS forwarding activity out of sight of the users. With proper mail routing and near global bulletin distribution, there is no need for BBS DXing.

Each LAN also has a gateway switch with ports on the LAN and on the high speed trunk. Any user can access any other user for keyboard chatting via the gateways. The 56 kb trunk has the capacity, lacking at user speeds, to allow simultaneous BBS to BBS traffic and user chats.

This is a very structured network and can be damaged by users not playing by the rules. It is very effective, however, as long as we can keep the gateways operating. The bane of the network engineer is the packet DXer hopping from channel to channel around the network looking for the furtherest point he can reach. This disrupts the automatic routing algorithms and can cause unexpected congestion in

parts of the system.

>   - Brian
In the Netherlands we some use higher packet speeds then 1200 baud on the
same frequentions as used by 1200 Baud packet. The TAPR 2211 DCD doesn't
detect those transmisions and the result are colisions! So use them with
care and transmit only when a noise squels says the channel is free.
When the big users of a packetchannel go to higher transmission speed
between them, the packet channel transmission time goes down and creates more
transport bandwith on a packet channel for the 1200 Baud users.

Henk, PA0HZP

Ps: I like to see a DCD detect circuit which detect also higher packet speeds
with a short carier detect time? Current I am using a fast noise squels.

Not to argue with the Brian's discussion I would pick the nit that it is *current* vhf amateur packet radio which is inherently a broadcast medium. We simply aren't able to use antennas large and directive enough to effectively be point-point in this portion of the spectrum. This situation is likely to predominate for some time. In that context I have no disagreement with Brian's position.

However, I (for one) live in hope that the broadcast nature of the lower bands may be eventually be supplemented with microwave and millimeter hardware which doesn't carry the broadcast/omni penalty.

Radio *is* inherently divergent barring some guiding structure. It will probably not ever allow the kinds of (terrestrial) information transfer efficiency of low loss guided structures that, say, fiber can but we shouldn't rule out the possibility of eventually having some relatively non-broadcast physical layer hardware. The information capacity advantage of this kind of channel is enormous compared to existing broadcast channels.

In the interim, I agree that it is extremely wasteful of resources to continue as we are. Within the forseeable future it will no doubt be that the user links will be continue to be broadcast or semi-broadcast. Even the Hubmaster stuff we are working on has antennas with omnidirectionality in azimuth. Dedicated point-point user hardware isn't likely to be widespread anytime soon. I think I can count on one hand the number of multi-Mbps systems which are actually running as a result of n6rce's and my article. I expect that small shared clusters/cells of semi-omni users are more probable than "stars" of full pt-pt users. By the time that most installations will have coordinated two ends with highly directive structures they probably will have been able to find a guided-wave alternative which is cheaper than radio and has even more capacity. In the end, the advantage of radio is the lesser degree of coordination/connection it allows. When it becomes more difficult/expensive to use than "plug-in" access it won't be attractive.

However, if we totally write off radio as being broadcast only I doubt that amateur radio stands much of a chance of continuing long into the information age.

Hi everybody,
I used to do packet with digicom + C-64, but now I've got a clone IBM
and I would like to know more about packet with IBM clones.
I know I could use baycom, but I saw among packet drivers by Clarkson
University a packet driver for the serial port which can emulate
SLIP KISS and AX.25. I read somewhere that ka9q program can be used
with this driver, and I guess I could use an interface between radio
and computer similar to the one I used with digicom (of course with the
right voltages for RS232).
Is anybody else using this program ?
Where can I "FTP" it ?

Thank you very much for your answers !
Mauro

I'm thinking of building a DSSS transmitter for Amateur Packet Radio
  whose PN is stored in a ROM/EPROM.

I'd like a table of generator polynomials up to order 10 that can be used
  for PN sequences. The idea being that I can generate the sequence in

  software and store it (and its brethren) in ROM/EPROM.

Before I hear loud shouts of "that's illegal"--remember that I'm in Canada,
  where the DOC now only cares about total bandwidth, and deliberate
  transmission obscurement.

The cheapest is to get a TNC-2 or clone and an old mobile 2m rig used.
Build your own 2m ground plane (plans are ubiquitous). Even so, this
is probalby the cheapest even if you don't use used equipment.
TNC-2's go under a variety of names such as AEA PK-88, ...

Alan Cox (iiitac@pyr.swan.ac.uk) suggests that I attach an ordinary asy
comm port and then enable ascii (not SLIP) users over the phone line
by typing 'start tip <iface>'. Well, it goes like a rocket !

A couple of things to watch for ..

The Modem MUST have echo turned off BEFORE starting NET or else NET
will interpret all the command echoes as login text and the lot will
eventually crash.

Get rid of the verbose messages so these don't interfere with net either.

The command string 'ate0v0s0=1' works with my modem.

Recently, John KB8GYS asked how long it takes to deliver a packet
message via NTS. He and I conducted an experiment. John sent me two
messages, one to my home BBS, and another via NTS.

The direct packet message was orginated on 05 June at 0357, and arrived
on my BBS on 9 June at 0149. Which is 3 days and 22 hours.

The packet message sent to NTS took 5 days. John sent it the same time
as the first message. It arrived in Freemont, CA the next day. That is
~25 miles from my home. Because of some problem in routing tables, it
went back and forth between two different BBSs. On the 8th of June it
got to the BBS that is designated for my zip code. Finally at 0300 on 10
June, I got a phone call from the asst. sysop to "deliver" the message.
He and I chatted about the strange path.

Meanwhile, Bill G3RXS in the north of England also sent a message to my
home BBS. It took 36 hours and 53 min from the time of origination to
arrival!

I sent replies via packet to both John and Bill. It will be interesting
to see how long they take.

In Northern California (San Francisco Bay, and Sacramento area), there
is a packet co-ordinating group. They do a variety of things to
encourage packet radio. One of them is frequency co-ordination for all
the BBS, DX_Cluster, keyboard to keyboard and other sorts of activity.

To get started on packet you need a technician class license. The
hardest part is the 6-8 week wait after you pass the exam. :-(
Don't let it get you it has been that way for decades.

For gear, you can use almost any 2 meter FM transceiver, either an HT or
a "mobile". For the antenna, start with a 1/4 wave groundplane mounted
outside, so it is away from any RFI generated by the computer.

Just about any computer with a serial port and terminal emulator program
can be used. Later, you might want to use one of the fancy programs
meant for packet, but if you already have a computer and program to run
a modem for telephone, that can get you started.

Then the TNC. New ones are about $130. MFJ, AEA, Kantronics, and TAPR
are popular brands. Actually TAPR is the amateur group in Tuscon AZ
which designed the first really usable TNC. The others are clones of
TAPR's design.

Lastly, you need cables to connect all of these. If you are not afraid
of soldering, these are not to difficult. The hardest part is finding
the pin-out pictures for your particular TNC and radio and matching up
the info in from the different manufacturers.

73, and good luck on your exam.

Well, it seems to me that a tapped shift register and an exclusive
OR gate is simpler and cheaper. The details necessary to generate
a table for your purposes are available in the ARRL Spread Spectrum
Sourcebook. Basically most PN sequences are variations of a basic
Fibnocci number algorithm. An order 10 PN sequence has 60 unique
maximal length sequences, each 1023 bits long. A linear feedback
shift register with taps at stages 7 and 10 would generate one of
these maximal sequences. If you want to do it in software, it's
easy to code a linear feedback shift register.

That's only easier if you want to use ONE PN sequence in the transmitter.
  If you want to be able to use multiple sequences (as in CDMA), an
  EPROM seems like the easier approach. Using an EPROM also means that
  you can do experiments to see which sequences work in real-life, and which
  don't, without rewiring your shift-register/XOR gates every time. I'm
  fundamentally a software dweeb, so my hardware inclinations are towards
  software-driven solutions...

I read the ARRL SS sourcebook treatment of m-sequences (admittedly late
  at night, when my brain was barely functioning), and found it
  heavy-going. I'll take another slug at it when I'm awake ;-)

I have uploded two MSYS 1.13 utility programs for FTP.

CALLSRV3.ZIP - WA8BXN's Interface to use the SAM Disk based CALLBOOK server
with MSYS 1.13 BBS software.

MTOOLS.ZIP   - WB0OIZ's collection of MSYS utility programs.

These programs are available for anonymous ftp from TOMCAT.GSFC.NASA.GOV
(128.183.10.100) and on UCSD.EDU as soon as Brian moves it.

Thanks to The Cleveland Hamnet phone BBS, Brian and Tom Clark.

Enjoy.

no. nntp replaces the combination of compressed batches and uucico.
The main reason I suggested tapping in at the uucico replacement level
is that there has been a large amount work done on full news packages for
many machines. these packages take care of article expiration,
user interface, collecting and dispersing articles, and all the other

things associated with maintaining a news site.

Well, I got into packet with Baycom/Baymod at $59.95 from Paccomm...It's
really portable (HT, cheap Laptop PC, Baymod modem-in-a-DB9) and works
fine. It does have the limitation of not being upgradable to 9600. If you
get a TNC, you can later install a G3RUH 9600 baud modem inside it..and buy
a new radio, hardware mod it, etc. I'm happy with the cheap solution right
now.

I've always used straight noise squelch on my 1200 baud packet, and
frankly it seems to work at least as well in practice as anything else.
My observation is that the several radios I've used seem to have
acceptably fast response time (at least we've never had to change timing
parameters because of squelch delay) and the adjustability of the
squelch is a Good Thing -- if you can adjust the squelch so it only
opens on signals strong enough to decode, you can ignore most
interference and the grunge that gets through would likely be strong
enough to interfere with reception, anyway.

URGENT!

In Croatia we are using packet-radio network for exchanging
medical and humanitarian data.
As we have also some PSDN connections, we are interesting
to integrate packet-radio and X.25 networks.
Could somebody help us by advising what sofware and hardware
components are required?
We are currently using MicroVax/VMS 5.4 and PC compatibles.
I heard that similar connections already exist and operate
in USA. I must add that I am not an expert in this field,
but all my efforts to find one with such an experience
in Croatia have failed.

Paul has given a fair snapshot of *current* practice, and a novice
user would be wise to follow this path *today*. But most advanced
packet experimenters recognize it as horribly inefficient, and even
evil, because of the congestion and poor throughput that it fosters.
After the initial thrill of connecting to a BBS or distant user
wears off, comes the cold realization that current packet practice
is worse than 300 baud dial up lines for *communications*.

Nost advanced experimenters recognize that high speed, narrow beamed,
point to point links result in a better network with higher thruput
for all users. New users would do well to review the literature on
these techniques and decide whether they want to become part of the
problem, or part of the solution. Many current users are trapped by
inertia and aren't going to change willingly. The hope of future packet
networks rides on the shoulders of fresh blood entering the ranks
who are willing to lead in a fresh direction.

Packet is a *cooperative* activity. The DXer mentality is the wrong
approach to effective packeting. You should concentrate much less
on your own station and more on the network *system* of stations.
The firmware in current TNCs is horribly at odds with effective
communications *systems*. Real LANs, MANs, and WANs need to be
organized along with effective switching technology to interconnect
them. Along with high speed point to point hardware, and controlled
access moderate speed wide area coverage hardware, this topology
promises *real* communications effectiveness for packet radio.

>The packet message sent to NTS took 5 days.

Interesting. How come it takes so long? I haven't been involved
with old-fashioned CW/phone traffic handling for many years, but as
I recall, when things were working right, a coast-to-coast message
took no more than a day. (Local net - region net - area net takes
one evening. TCC that night or next day. Then area net - region net -
local net the next evening).

Of course, it often takes longer, usually due to routing or
delivery problems at the local level. Is the problem the same with
packet messages?

I am really impressed with the Baycom software. It is written better than
a lot of the TNC software and is very easily upgradable (I just download

the version 1.5 update via FTP). A few corrections, however. The hardware is made by a lot of companies (my packet modem was made by Tigertronics and I'm not terribly pleased with their "RS232" interface). It is small (fits in a DB25 shell and derives power from the RS-232 port). However, in reading the manual for the software, the implication is that it is not constrained by baud rate at all. The software can be set to work at any rate the hardware can handle. Thus the G3RUH modem, which would have to added to a TNC to get 9600 baud, could also be made compatible with Baycom's use of the RS-232 port on the PC and then used with Baycom.

Since, as I noted, it's trivial to do a linear feedback shift register
in software, even the most brain dead single chip micro can handle it
in it's spare time, the use of an Eprom lookup is hardware overkill.
Since it's "only software" you can change the taps on the fly. You'll
have a micro in the design anyway to do channel control and protocol
conversion so you might as well get your money's worth out of it.

>I read the ARRL SS sourcebook treatment of m-sequences (admittedly late
> at night, when my brain was barely functioning), and found it

It isn't as clear as it could be. Simply try coding a hardware emulation
of the example linear feedback shift register in software and you'll see
it's not really complicated.

The main one is error detection and retransmission on a small chunk
level. Much like Xmodem, packet does CRC data integrity testing and
positive acknowledgements on a packet by packet basis. In addition,
AX25 offers a rudimentary routing function and the amateur TCP/IP
has the full routing functionality. And, unlike most computer communications,
it can be used mobile in motion.

W 2 A <---> TNC ? ? ?

Would someone explain how to interface a W2A to a packet TNC? The
W2A has the earphone/mic/PTT connections on a single jack unlike
the older Icom radios that have separate jacks for earphone and
mic/PTT. Maybe this has been published in a recent magazine, but
I haven't been able to find it.

Thanks, Ross

I recently bought a W2A and being too impatient to run around town
searching out components bought an AEA interface cable at the same time
(not recommended: it works fine, but cost $25!). It uses the same R + C
interface as the older Icom models to a stereo-type phone plug where
the TNC audio input comes from the tip, AFSK/PTT goes to the ring, and
the sleeve is common. Remember to turn off one receiver or you'll get
audio from them both into the TNC!

Er, yes on no....   It's supposed to require a license including data
modes, F9 or something for the 'emission type'. Apparently the FCC
isn't too concerned, though. Motorola has been putting up Mobile Data
Terminal systems on various frequencies ignoring the emission and user
restrictions.

Seems like AEA makes a commercial TNC, probably not exactly AX.25. They
probably give you specific info on license requirements.

Last week I had some trouble hooking up a cable between my 411 HT and
the 1270b: I could receive okay, but PTT wasn't working. With some
help from MFJ, I got a cable working to activate PTT (using an
RC circuit on the cable), but now it's putting noise back into
the receive of the radio (about S7), so I can't get anything.
Would anyone know why this would be happening? It's incredibly
frustrating. Thanks in advance for any help...

In a previous article, ayman@umich.edu (Ayman Kayssi) says:

>Are there any advantages to using packet over other means of computer
>communications? Just wondering...

Well, it depends upon what you're trying to accomplish. The only thing
that I have noticed, is that, relative to landline BBS's, packet is often
PAINFULLY slow. Part of this is due to the fact that there are many
different stations using the same frequencies.

However, there is all kinds of stuff you can do on packet that you can't do
on landline BBS's. There really is no such thing as a busy signal on
packet. And there are plenty of "chat areas" on packet, most of which are
very rarely used. There are alot more people in packet, I'm sure, than
there are on Internet -- and some of the people on packet are in some

downright exotic locations.

Something that's on packet, but nowhere to be found on landline BBS's is the National Traffic System. You can log onto your local packet BBS and send up to 25 words to anyone in the United States and a handful of foreign countries. The message is sent absolutely free and generally gets to it's destination in a few days to a week.

And, most logically, there is alot more ham related stuff on packet than on most landline BBS's, and certainly more hams <<Grin>>.

Also, it's pretty difficult to get on a landline BBS from your back yard or anything ... with a portable computer and an HT, you can work packet from anywhere there's an ability to get into a packet board. Oh, also ... there are packet boards on HF, so it's possible to communicate via computer from the comfort of your own RV!

Subject: RE: Wanted: Table of m-sequence polynomials
Date: 13 Jun 1992 16:42:56 -0700
Organization: UCSD Usenet Gateway
Lines: 88
Sender: daemon@ucsd.edu (The Devil Himself)
Message-ID: <9206132342.AA21684@ucsd.edu>
NNTP-Posting-Host: ucsd.edu

 M-sequence generating polynomials can be found in several
 publications. For those not familiar with what this is all
 about, these generating polynomials are used to generate
 pseudorandom sequences for spread spectrum communications
 and for test purposes. They are also used to make
 "scramblers" to randomize the occurence of bits in some
 modems to aid in synchronization.

 "Digital Communications" by John G. Proakis (McGraw-Hill)

has a list due to Forney. It only lists one polynomial for
each m even though there are often many.

```
 m   Stages connected to mod-2 adder (OUTPUT IS LOWEST STAGE)
 2   1, 2
 3   1, 3              To construct the generating polynomial
 4   1, 4              instead for say the m=5 one in the list
 5   1, 4              (with connections 1, 4) write 100101
 6   1, 6              where a "1" is in pos. 1 and in pos.4,
 7   1, 7              with another 1 placed in pos. 6
 8   1, 5, 6, 7        (m+1=5+1=6).  This corresponds to
 9   1, 6              the polynomial 1x^5+0x^4+0x^3+1x^2+0x+1
10   1, 8              or x^5+x^2+1.  This polynomial is also
11   1, 10             denoted "45" which is obtained by
12   1, 7, 9, 12       converting binary 100101 to octal.
```

Thus the m-sequence generator for the example x^5+x^2+1
(which has taps at stages 1 and 4) is visualized as:

where a box with a number indicates a shift register.

Another source of such generating polynomials is
"Error Correcting Codes" by W. Wesley Peterson and
E. J. Weldon, Jr. (MIT Press). Appendix C lists
irreducible polynomials (in octal code as described
above). Much of this table is due to Marsh (1957).
The ones that are m-sequence generators are the
"primitive polynomials". (Those denoted E, F, G, H
in the table.) Some of these are:

```
  m   Primitive polynomials
  2   7*            Note this is only half of the primitive
  3   13*           polynomials as the reciprocal of a primitive
  4   23*           polynomial is primitive and only 1 of the 2
  5   45* 75 67     is listed.  The reciprocal of 23 or 10011
  6   103* 147 155  is 11001 or 31 (which is in the first list).
  7   211 217 235 367 277 325 203* 313 345
  8   435* 551 747 453 545 543 537 703
```

Starting with m=9, there are too many to list here.

The ones marked with * are the ones which turn
out to be the polynomial that was in Forney's list.

     In the US, the FCC allows radio amateurs to use
certain pseudorandom sequences to generate spread spectrum

signals. These are the following:

```
 m   Taps uses in feedback (OUTPUT IS HIGHEST STAGE)
 7   1, 7          (gen. poly. is 203 octal,  010000011 binary,
                    or x^7+x+1)
13   1, 3, 4, 13   (gen. poly. is 20033 octal,
                    010000000011011 binary, or x^13+x^4+x^3+x+1)
19   1, 2, 5, 19   (gen. poly. is 2000047 octal,
                   10000000000000100111 binary, or
                   x^19+x^5+x^2+x+1)
```

These correspond to the corresponding ones in the Forney list
once the stages are re-numbered to accound for the difference
in numbering the stages. (Subtract from m+1 to do this.)

I have seen pseudorandom maximal length sequences transmitted
on HF by various US State Department stations. These used the
polynomial x^9+x^5+1 (which is 1000100001 binary or 1041 octal
--which is the reciprocal of the polynomial 1021 octal
in the Marsh list). This will give a pseudorandom sequence
of length 2^9-1=511 once seeded with any not all zero 9 bits.

> EPROM seems like the easier approach.

Well, it depends on the specific CDMA scheme. You can use the same PN
sequence at each transmitter if you have some way to assure that each
transmitter will use a different part of the sequence so they won't
coincide at the receiver. Qualcomm's CDMA system works this way --
everybody uses the same "short" and "long" PN codes. Collisions
between the short codes on the forward links are avoided with
allocated timing offsets controlled by global synchronization to GPS.
Collisions in the long code on the reverse links are avoided by using
offsets that depend on the unit's address. The latter technique is
probably applicable to what you want to do as long as the receiver has
some idea of where in the long sequence it should search for
acquisition.

Another alternative is to use a family of Gold codes. These can be
generated with a pair of PN generators (using different polynomials)
whose outputs are XORed. You generate different sequences by setting
different initial starting states in the two PN generators.
(Equivalently, you can start all of the generators at the same state
and take different taps off them for combining.)

GPS works this way -- each satellite has a unique Gold code generated
from a standard pair of PN generators. The polynomials used in the
latter are the same for all satellites: 1 + X^3 + X^10 and 1 + X^2 +
X^3 + X^6 + X^8 + X^9 + X^10. Only the starting states for the two
generators differ for each satellite.

This second approach is useful when you have to use a short sequence
to make brute-force acquisition feasible (i.e., searching the entire
sequence space at the receiver) and you cannot guarantee that multiple
transmitters sharing the same PN sequence wouldn't "collide" at the

receiver.

BTW, an excellent overview of GPS's use of spread spectrum is in the
book "Radionavigation Systems" by Boerje Forssell, published by Prentice
Hall in 1991. ISBN 0-13-751058-6. I found it on my last trip to Computer
Literacy. I highly recommend it as a very readable reference. In addition
to basic principles, it describes the specifics of Omega, DECCA, LORAN-C,
DF, VOR, DME, ILS, MLS, Transit, GPS, GLONASS, TSIKADA, Starfix, Geostar
(now defunct), and Navsat (proposed). About the only one missing is
Qualcomm's QASPR system in Omnitracs.

Hi, I'm looking to buy an HT and a TNC, I'm a tech class and PC type person.
I want to buy components that will carry me into the future a bit, namely
being able to handle 9600 baud sometime. Does this mean i'll need a dual-bander
for an HT, and what constraints on a TNC? Any specific recommendations?

Mike

  Have you been trying to find the perfect packet radio communications program for your Macintosh computer? Well, you may have just found it. Virtuoso is a communications program written specifically for packet radio. This means that it has features that you as a packet radio operator need and also packs a lot of bells and whistles to keep your packet radio communications smooth and effortless. The current version is 1.3.

  Virtuoso is a shareware program with a price tag of only $20. It is available on America Online, GEnie, CompuServe, and various ftp sites.

The following is a list of some ftp sites where you can find Virtuoso:

ucsd.edu:
     /hamradio/packet/misc

hpcsos.col.hp.com:
     /packet/ke0ph

pacific.mps.ohio-state.edu:
     /public

sics.se:
     /pub

Some features implemented in Virtuoso v1.3 include:

  -Word Mode - Useful for RTTY and AMTOR.
  -A powerful scripting language to automate routine tasks.
  -Automatic execution of a script when starting and quitting.
  -Save incoming text to a disk file.
  -Send a text file from a disk.
  -Append a selection of text to the end of an existing file.
  -Print a selection of text.
  -Column counter display
  -Word find - useful for finding the last time you heard someone.
  -Spelling checker(Dictionaries Necessary). Checks the words as you type them.
  -Split screen (rx and tx) which can be adjusted easily.
  -Windows can be scrolled up to see previous text (Up to 32000 characters).
  -Full font, size, style, and justification support.
  -Supports 300 - 19200 baud.
  -Keyboard buffer window so you can type in long messages of text
     before they are sent over the air. This window supports full
     cut, copy, paste, clear, and undo like any good text editor
     does. To send the message, just hit Command-Return.
  -Use the control key (or the command key if you don't have a
     control key) to send control characters to the TNC.
  -Option to strip off line-feeds, or all control characters on
     the input before it's displayed on the screen and saved to
     disk. Control-G's can be passed through to beep your computer

     if you want.
  -Virtuoso can automatically put your TNC in KISS mode upon
     shutdown, and take it back out at startup. This is useful for
     TCP/IP'ers.

  This file has been checked for viruses with Disinfectant 2.5.1
before uploading.

  If you cannot find Virtuoso anywhere, send me some e-mail and I'll get
you a copy. I also appreciate any and all comments, suggestions, and
criticism. That's the only way I'm going to know what to fix and improve
for the next versions.

  The PK-90 manual I've looked at indicates the PK-90 is essentially
the same design as the PK-88. The differences are quite minor; in fact,
the PK-90 could be *upgraded* to PK-88 level quiet easily. While I
haven't tried it yet, the manual indicates that interoperation with
regular AX.25 nodes should be a snap.

Hello, i'm looking for a list with all Tjechoslowakia AX25 BBS's.

Who can help me?

Also the QRG's and QTH locations if possible.

Regards, Wim

  Hello,

I have two MFJ-1270B TNC's and downloaded the 1.1.8 firmware from a bbs
system (I don't remember where), and then burned my own ROM's for my TNC's.
Anyway the short of the story is that they both worked fine, so it must be
possible to make them work. You may have a bad ROM, or maybe somthing
shanged at some revision level in the MFJ. My MFJ's both have 32K RAM, if
that makes any difference (I believe it is required for 1.1.8)

***** ATTENTION!!! - NEW Phone Numbers for the WB3FFV BBS!!! *****

==========

+--+

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs

Number: (410)-661-2475 -- 1200,2400,4800,9600,19200,38400
(V.32/V.42/V.42bis/MNP1-5)

Number: (410)-661-2598 -- 1200,2400,4800,7200,9600,12000,14400,19200,38400
(V.32/V.32bis/V.42/V.42bis/MNP1-5/HST)

Number: (410)-661-2648 -- 1200 & 2400 (MNP1-5/V.42bis), 9600 & 19200 (PEP)

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS) Version 7.91u
IP Address: 44.60.128.1 {wb3ffv.ampr.org} [for FTP transfer via PACKET ONLY!!]
Misc. Info: Machine is an 80486 computer running UNIX V.3.2 and features more
than 1.5 Gigabytes of on-line file storage.
Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS] (Version 1.2 & 1.3)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 10.xx, 11.xx, 12.xx, 13.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07-1.11)
AA4RE BBS for the PC (Version 2.11)
F6FBB BBS for the PC (Version 5.14 & Updates)
G8BPQ PC-Node (Version 4.05)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01 1.16 & 2.06, 2.08)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Phil,
     How DARE YOU come up with an inteligent way of solving the problem.
Just how could you be SO cruel as to recommend a method that would allow people
to 'decide for themselves' what they would like to read.

Never mind. I DIDN'T control myself ;-)

73's de Mike

P.S. Hope you get a chance to come another SCDCC meeting, so some of could
meet you.

I also suggested it. Back around 1986 when I set up my first experimental
Packet UUCP link.   Basicly, I just replaced a phone modem with a TNC and
everything flew.

I am sure it will get as much attention this time as it did then. :-(

A friend has asked me to post this for him . He has an apple 2c and wants
to dedicate it to packet radio. Is anyone aware of software that is
specifically designed with the 2c in mind, or, is other apple/mac software
useable on the 2c?
thankyou.

Darrell--

Your friend can run a standard Apple II terminal program, or something
written specifically for packet radio. In the latter category, I'm
aware of the ones listed below. I haven't tried either of them myself,
and I collected some of this information quite a while ago, so you'll
have to contact the vendors for current information.

(or by me, for that matter)

Packet radio
PACHAM
Complete AX.25 packet program that works with a two-microchip interface
instead of a TNC (schematic included with program). Connects to the
transceiver via the computer's game I/O port. DaJu Development Company,
39 Long Ridge Road, Carlisle, MA 01741.

APR (Apple Packet Radio)
For use with TNC-2s. Send a formatted 5-1/4 or 3-1/2 inch disk and a
stamped, self-addressed disk mailer to Larry East, W1HUE, PO Box
51445, Idaho Falls, ID 83405.

73,
Patty

Keywords: packet modem

I recently received a packet modem compatible with Baycom software. It was
purchased for me at Dayton by a friend. I got some help from net earlier
with wiring the telephone modular connector to my 2 Meter radio since there
was a total absence of written or computerized documentation regarding this
small detail.

The modem, which fits in a 25 pin RS232 shell, is compact and is powered
from the RS232 port. It is made by a company named Tigertronics.

I have been having some problems getting it to work. It seems to transmit
properly but is completely deaf on receive. When I put a scope on RS232
pin 5 (the CTS "status" line Baycom uses for serial data input), I get a
waveform that looks right (nice and square, widths look like 1200 baud) but
the signal level varies between 0.1 and 3.4 volts. The company claims that

this should work with most RS232 ports, even though the RS232C standard
specifies a Mark (logic 1) level between -3 and -27 volts and a Space
(logic 0) level between +3 and +27 volts.

Any ideas of how to fix this? The company only suggests getting a
"compatible" RS232 port (and spend as much as the modem costs) or to try
placing an LED in series with pin 5 to shift the voltage down (which could
not and did not work).

All help will be greatly appreciated.

Have any of you ever sent any NTS messages via packet, say, to
a non-ham friend a few hundred miles away or so? How long did
the message take to arrive?

      Thanks!

I sort of fake doing "newsgroups" when I'm on my local packet BBS (a RATS
board) by not doing a "l", for list everything, command. What I do is a
"l -s mods" if I just want to see articles with the word "mods" in the
title. Or do "l -s nasa" for articles with "nasa" in the title. This
cuts down on wasted time and bandwidth on listing articles I'm not likely
to care about, like "HT for sale". Obviously, this is a feature in the
BBS's software. Though, it's somewhat leaky, as "Commodore" will get
passed by "l -s mod".   ^^^
Will have to check to see if a similar command does a sort by distribution
code(?), ie, AMSAT@WW, MODS@WW, DX@USA, etc

I'm just starting to get active in packet but have already started
thinking about adding a G3RUH 9600baud modem to my MFJ-1278. So far,
no one has been able to tell me if my Alinco 560T HT will be
compatible with it.

Other miscellaneous "getting started" or MFJ-1278 tips are also
welcome, of course.

LOGFILE: KA9Q
Both the MFJ1270B and PacComm TNC-2 tncs are supposed to be TAPR TNC-2
clones. The descriptions in then manuals for the TTL pin-outs don't
match. Does anyone know if the TTL pinouts are supposed to be the same,
or what? If they are different, has anyone made an interface cable that
make the TTL pinouts the same? I have a device that connects to the
TTL port of the PacComm TNC-2. I want to connect it to the MFJ-1270B
TNC, but I am worried that I will have problems since the pinouts don't
seem to match. Any info would be appreciated.

Interesting. I have found that it depends entirely on the current conditions
and your specific situation (proximity to an hf gateway mostly). I have
seen transcontinental messages delivered within a few hours. I used to
regularly receive mail in Atlanta delivered from New York in 5 to 6 hours.
The path was amazing - it almost always made its way from New York down
to Maryland, then down to Miami on hf, back to South Carolina also on
hf, then vhf terrestrial down to Atlanta. And in only a few hours. It
is truly amazing to see...

Lots of people have suggested it. The packet BBS network does a reasonable
job of moving mail and bulletins around, but as a Usenet-type conferencing
tool, it's a dud. No amount of tinkering will make a silk purse out of it.

On the other hand, it's too facile to simply say "replace it with Netnews".
I'd love to, but it ain't that simple! Let's see some practical suggestions
on how to implement such a thing in the packet radio environment...

Yes, NOS has some NNTP capabilities. Yes, it's now possible to run Unix
on your 386 box for next to nothing. Yes, Brian Kantor and others are
looking into implementation of a broadcast protocol for efficient news
distribution to packet users. And so on... But it's not clear to me how
we could start implementing a packet Netnews network *today* that would be
accessible to all packet users.

Enlightenment, anyone?

I want to send a packet bulletin to a distribution covering central
and eastern Pennsylvania, as well as northern and southern New Jersey.
What is the current method for addressing ALL@ type messages?

A question I have often pondered. 8-)

I check this newsgroup regularly because I am considering setting up a
Packet Radio node, probably connected to some sort of 386 PC. I haven't
seen any traffic to encourage me, but.

Does anyone use packet radio in the UK?

The main reason is far simpler. The typical packet user (who probably
has enough trouble at the DOS prompt) can not cope with the extensive
commands and options offered by netnews.

I run a land line BBS and know this from experience.

And conversely, those of us accustomed to netnews can't cope with the
limited commands and just plain weird conventions of PBBSs!

For instance, why on earth will a PBBS accept "B" and "L", but not the
full commands those letters abbreviate (BYE and LIST, respectively)?
Aargh!!

And in the listing of available bulletins and personal messages, why is
the destination BBS after the *sender's* callsign instead of after the
recipient's callsign? E.g., if I send a message to KA9Q @ K3MC, it
shows up in the listing as "To KA9Q" "From N6BIS" "@K3MC".

Not to mention (okay, I'm going to anyway) the utterly delightful
inability to break out of reading a message once it's started spewing
onto your screen.

Oh well, if that's what BBS and PBBS users prefer--chacun a son gout.

You are painting all packet BBS prorgams with a broad brush. I think
you will find most of the programs overcome the objections you raise.
I know mine does.

To many of the others that comment that packet BBS should do this and
that: I make my source code freely available. Please add your ideas
to the program and ship the modifications back to me for incorporation
into the master copy. Over the years I have received five or six such
contributions. Everyone of them is in the code today.

Hi, Roy.

Over the years, I have used 3-4 different PBBSs in the Bay Area
(Peninsula and South Bay). All of them have had the drawbacks I described.

Perhaps they all use the same software (W0RLI?). If your program is
better, I certainly hope that more sysops will switch to it.

Patty

p.s. If there's someone in the Sunnyvale area using your software
(I can't work as far as Gilroy), please tell me the callsign and
frequency and I'll gladly try it.

Being rather cheap, and enjoying endless hours of tedium checking
parts of lists, soldering, and clipping leads, I have undertaken
to assemble a *real* TAPR TNC-2 from the excellent blank board
supplied by TAPR, and by scrounging parts wherever I can. Unless
your junkbox runs to 20-turn trimpots and CMOS EPROMS, this is not
the way to save money, but its fairly educational and with luck
I'll break even with the cost of buying a store-boughten TNC.
My question to the world is: TAPR sells an XR2111 replacement for
carrier detect that they say does wonders. Is it in fact a worthwhile
addition to the TNC 2 ? Any particular pitfalls in the orignal TNC
that I should watch for ? Should my next order to TAPR be for the
KISS software ?
  I started off assembling the K9NG kit but after two months,
there's still no-one out there to talk to on 2 metres; all the
9600 in this area is on UHF. I *still* think I can do it on 2, though.

  I'm looking for a small terminal (preferably something backlit or that
can be seen in the dark) that would be fairly rugged and small enough
to be mounted in a car with a full "QWERTY" keyboard.

  Anyone know of such a monster?

The TAPR 2211 DCD mod is indeed useful. It's easy to install; you just
plug it between the 2211 chip and its socket, and chop out a resistor

on the mainboard. What it does is allow you to run with an unsquelched
radio, which will greatly improve your receive carrier detect time. It
also reduces chatter of DCD on marginal signals. A good deal for $20.

Greetings,

After a productive morning at the local hamfest I am now the proud owner of a 2M packet station. I picked up a Wilson WE-800 2M FM rig and a Kantronics KPC-2400 TNC for $160.

I would like to correspond with anyone currently using the KPC-2400 for packet radio. Having scanned through the manual once or twice now it appears that I may have the front end of a packet bbs system. Is anyone using the KPC for this? If so, what sort of computer and what software are you using? Are there any do's and don'ts that I should be sensitive to?

As I just passed my Tech exam on May 9th I suspect that I have several weeks yet to work things out.

At a hamfest yesterday I picked up a Heathkit HK-21 Pocket Packet at a good price. Unfortunately, it came with no instructions, accessories (?) etc.

I called Heath and ordered a manual, but it will not be here for a week.

Some of the connections are self-explanatory, but others are not. Can anyone give me a quick explanation of the connectors, how to set the baud rate, etc. So that I can try to get it up before the manual gets here? (I'm going on vacation at the end of the week, and it sure would be nice to take it along with me, but I don't think that the manual will make it here by then.)

BTW, I assume that there is an external charger for the ni-cad battery?

Thanks

It is legal, and if you call AEA they will treat you much better
if you tell them you're commercial. They have a device called a
PK90 which is essentially a PK88 with a 2400 baud modem, and even
encryption. They recommend Maxon (nothing fancy) commercial radios
and the interface is similar to hooking up any other TNC.

There are also fancier commercial packet companies out there as well.
Some even mention the protocol as AX.25.

I have seen several references regarding TAPR TNC-2 kits. Could someone
who has built one please drop me a note describing the approximate size
of the unit, power requirements, and $$$.

Tnx,

This is my half-penny's worth on the topic.

Here in the Cleveland Metropolitan area, 145.03 was originally a 'real time' qs
o frequency by informal concensus. It has 'almost' remained that way except fo
r the existance of one major bbs, which was infact the sponsor of the realtime

qso frequency. This frequency still ramains one the main, if not the main, rea
l time qso freq. Besides the main bbs there are a host of other personal mailb
oxes that beacon on the frequency, but they are essentially low use.

One of my concerns about the activity on packet is the proliferation of the maj
or bbs's on a single frequency. At first glance one wonders if there could not
be some enhanced coordination (without bureaucrary) so that there would be a na
tional bbs, a regional, and a metropolitan. This would hopefully reduce some o
f the traffic and free up the airwaves for more packet activity.

On the other hand, maybe all of this is superflous! THIS IS A HOBBY!

I have an older MFJ 1278 Multi-Mode TNC I will part with for $150 This
included the Book, TNC and power supply. I can also put a disk in the
box with lan-link 2.0 (Shareware) to get ya up and started. The reason I
am selling it is I spotted a good deal on a newer one and need the buck
(Plus some of mine) to get it. Will split the shipping charges not to
exceed $6. If your interested let me know. I'm posting this every where
I can. TNX

I have an old computer - radio interface device which was designed mostly for
RTTY (not AMTOR) and so on, but is not packet capable by itself. Can't re-
member the model number and have shipped it to my son some time ago. I was
wondering if either the poor man's packet or "Multy (?)" or other software
can do the packet assembling/disassembly etc in such an arrangement? Has
anyone worked this approach? Can anyone recommend/not recommend
Poor Man's Packet and mail order kit?

  Thanks for your reply Ron. I also have done quite a bit of checking around and have also been told the same, packet is legal commerically. As well as being able to encrypt the data commerically, I'm also told that some commercial version packet controller are the same as the AX.25 unit that the ham radio operators are running, but just as odd baud rates so that the standard AX.25 controllers can't monitor them.

I've tried both. Pound for pound, 2 meters is better for 9600 than UHF, as well as not having radar problems like 70cm. However, with the TEKK radios being plug and play, and only the (terrible) DVR 2-2 being plug and play on 2 meters, most activity is on 70cm.

I see a (somewhat) common thread. Dos, amiga and (even) atari boxes have some
form of uucp based netnews software. these packages accept compressed
news batches and uux files to tell the system what to do with the batches.
it would be a "simple" matter to replace a uucico with "yet another
protocol" to send and recieve data over a basic TNC.

Even though some might complain that sending the information
point-to-point via a broadcast medium is inefficent (it is!) I think
the experiment is worth trying.

[... stuff about expensive Ramsey kits ...]

>synthesized tuning. (don't let anybody tell you that it "costs" more to put out
>a kit... think about it.)

It often costs more to "make" kits than assembled products. There was a long
thread about this a few months back on 'sci.electronics' about the demise of
Heathkit. The two biggies that make kits expensive are volume and complexity.

Production of assembled components in high volumes is surprisingly cheap. Kit
companies never seem to get the volume they need. Supposedly, at the very end
Heath was still hand-stuffing components into little baggies.

Kits often can't be as complex as assembled products. Look inside your HT
and think about hand assembling it. Kit builders usually don't have the test
equipment that the production line and service tech have. Finally, kits are
designed to be built and *work*, usually at the expense of performance.

It is getting to the point where food is the only thing you can save on by
making yourself.

Ideally, I'd like to find a box that takes in a fixed 70cm-band frequency
and puts out baseband in-phase and quadrature signals. But I'd settle for
an I&Q demodulator module that would work at or below these frequencies.
The only modules that I've seen so far are for higher frequencies up in
the cell phone range. I'm just trying to get out of having to tweak
individual mixers.

Any leads to sources for such things would be appreciated.
Thanks,

Ok. Here is someone who thinks the Ramsey kits are a good deal. I
bought one in Dayton last year (the 2m transceiver) and had a great
time building it. The diode programming was exactly what I was
looking for since I had in mind computer remote control of the
radio.   Were there some problems with the radio. Yeah, but I had
pretty good support from Ramsey when I called, and I changed the
design in a couple simple ways that made the rig work near spec,
and be legal ;-) I had a great time putting it together, and learned
a heck of lot more about RF engineering in this one project than
the last 18 years of licensed operations has tought me!

>   2) In hindsight, the Ramsey kits are ridiculously overpriced for what

> compared to $230 or so for an Alinco "data radio" which is assembled and has
> synthesized tuning. (don't let anybody tell you that it "costs" more to put out
> a kit... think about it.)

Well, then you're being ignorant if you don't listen to them. Cuz
it isn't that cheap. I've just recently gone through the exercise of
looking into what it would cost to market a kit, and still make some
profit off of it. The design I did is considerably simpler than
the Ramsey radios, and mostly a digital design. The cost of the
PCB was going to run between $10 and $15 in quantity. The parts
cost was going to be about $30 in quantity. A reasonable manual
costs $2, and packaging of the kit another $3. So you have $40 for
the basic package. There is a standard multiplier of 4 to account
for all of the distribution, R&D, and marketing costs. That puts
the kit right at $120. When I looked at what it would cost me up
front in detail I found the times 4 multiplier off, and the actual
cost was going to be about $160 for me to make a $10 per unit
profit. After all is said and done, it turns out that something
of this complexity level just can't be sold for less than about
$150.   You claim that it can't cost more to put out a kit, well
actually, assembly and test time are significant, and would probably
add $20 to the $40 cost of my unit. Considering how they are
marketing the unit, I'm impressed with what they've been able
to achieve!

>   3) The Ramsey packet modem kit cost me $70 on a Dayton "special".

> It is basically a Baycom circuit with little documentation other than assembly
> instructions. You can get Baycom "kits" for $40, and the Baycom documentation

I can't speak to this, no experience with that kit.

>   4) And whatever you do, don't *assemble* your Ramsey kit. They
> won't give you a refund in that case. :-) (although I haven't given up yet!)

> I wish that somebody had warned *me* about Ramsey before I plunked down my
> $70. sigh.
>
> 73 de kb8cne, Brad Banko

If you were trying to save $30 bucks, or the equivalent with the
transceiver, then you missed the whole point of the exercise of
buying a kit.

>designed to be built and *work*, usually at the expense of performance.

>It is getting to the point where food is the only thing you can save on by
>making yourself.

Last year I put together a garden. These were my costs:

1. 8 Tomato plants @ $0.69 each
2. 4 Basil plants @ $1.19 each
3. Bag o' lime: $2.39
4. Garden hose: $8.95
5. Shovels, rakes, other implements of destruction: approx $30.00
6. Trips to the garden store (round trip 12 miles at $0.25/mi): $3.00
7. Owl scarecrow to scare away the **^&^&^ squirrel: $9.95

Total: 64.57

Item #7 was entirely ineffective. The squirrel never managed to learn that
he didn't like green tomatoes. He would pick one, take one bite, then
toss it on the ground in disgust. The process was repeated often.

I finally got about 4 tomatoes. This averaged $16.14 per tomato. Next time
I will forgo the kit and buy the assembled product at the produce section
of the grocery store. Food can be expensive, but not nearly as bad as the
do-it-myself version. :-) (All in the spirit of good fun!)

I am in the process of puting a TAPR 9600 baud modem kit together. I
currently use a crystal controlled rig, Drake TR22 for packet on 2 m.
Can I use the same channel for 9600 baud packet? (Of course, I would
only be able connect to others with similar capability.)

I purchased a TAPR 9600 baud modem kit along with the disconnect and
DCD kits. Looking thru the modem manual they mention that they
haven't gotten around to figuring out the interface with the AEA PK 232 MBX.
They have a section on Pk 232 , an older one with a daughter board for mail.
But they do not have instructions for the PK232 MBX. The instructions for
the PK 232 call for connections to the daughter board which my unit does not
have.

I would appreciate any information on interfacing the modem with my TNC.

Thanks
Rajiv

Lines: 30

For those looking for info on the PacketTen 5 port NOS based
switch, you might Email Don Lemley (N4PCR) at donl@gracilis.com
for info on the switch. Our group is using one that covers the
Middle Tennessee area, and it has been up and running well since
around February of this year. It is capable of megabit data rates
and from what I have seen, it seems to be a very reliable way to
implement TCP/IP / Netrom and AX25 traffic. It runs a ROM version
of NOS and is very flexible in configuration possibilities.
For those that do not like to take trips to the hill, it can
be configured remotely and supports Telnet capability. Once it
is running with a minimum configuration the setup can be modified
remotely by packet or landline (with a modem).

Another thing that might be of interest, There is a list that
has been started for the gracilis equipment, it can be reached
by email by sending a SUBSCRIBE message to : gracilis-l@knuth.mtsu.edu
Changes, bugs, and other things may be found on this list from time to time.
The Packeten Switch is a relatively new product, I do not work for them,
but have been very impressed with the effort this company has made to
improve the capability of amateur packet state of the art.

My .02 Worth...

Dave

Seems like we've been through this one before.

Since TCP/IP uses standards on the way things are done, and programs like KA9Q's NOS/Net are so flexible and follow a few basic rules, I can far exceed the mailing capabilities of any packet BBS out there. One of the biggest problems I'm having now is with the incompatibility of the message formats.

I have absolutely no problems when an AX25 BBS forwards to a NOS system or mail comes in by NNTP, SMTP, etc..., but since the BBS's can't handle existing world-wide standards, do we have to keep modifying the programs out there to follow non-standard practices that the AX25 BBS's are using?

Some versions of NOS (like PA0GRI and WG7J) have gone as far as including a SMTPTOO command which will remove the SMTP headers in a message and replace it with an R: line. Why should you even have to remove a standard like the format that the SMTP headers are in just because the BBS sysops's complain about the long headers. The headers are there for AX25 forwarding too, but the software usually suppresses them. Why not suppress SMTP headers too and leave them alone?

Also the BBS programs can't seem to read the SMTP headers. They are in a nice simple format and are very easy to read, so I don't see what's so hard about adding it into their code. When I send a message for both distribution via SMTP and AX25 BBS and I send it from a NOS system, the messages usually don't work correctly. An example would be how I would send a message to all@detroit on the TCP/IP side and also send it to TCPIP@SEMICH on the BBS side. In header of the message there is a To: all@detroit and a Cc: TCPIP@SEMICH . When it gets forwarded to an AX25 BBS, the message ends up as all@detroi (note 6 characters). A NOS system can see headers coming in and know what to do with them. An AX25 type packet BBS can only accept the to@bbs < callsign format and always seems to get lost on the hostname type formats. NOS can easily be modified to handle whatever format the AX25 systems decide on, but it should be a system that is upwardly compatible.

So far I am seeing more and more new ideas popping up which is making the AX25 type BBS's not upwardly compatible or catching up with programs such as NOS. I am dropping the BBS program that I use as a gateway (I've run MSYS, AA4RE and F6FBB) and I'm going completely to a NOS system since it can talk to about anything out there (TCP/IP, NETROM, AX25, can run ethernet, do real networking, will support UPPER and lower case in a script file, etc...) and there are far more capabilites in the program.

Also please don't tell me that MSYS has TCP/IP, NETROM, etc... I've run it for years and the TCP/IP is badly broken and NETROM doesn't work nearly as good as it should. The TCP/IP is virtually useless in the program. If the BBS's can add in capabilities to handle other formats, or at least the capability to handle an RFC standard, then they will probably gain a little more popularity and be far more flexible.

Before any responds about the work involved in a BBS, I have been a BBS Sysop on several systems and am currently one on one of the largest BBS's in the state of Michigan and I've run nearly every U.S. and European BBS program that exists and I run the Detroit TCP/IP switch and several NET/ROM nodes and just about every version of NOS/Net that there is (IBM, Amiga, Mac and nearly every version of each), so I am very very familiar with the operation of the systems and what's involved.

Looks like Phil wrote a fantastic program with his TCP/IP for packet radio and I plan on replacing all the non-standard systems with NOS and watch the BBS programs try to catch up.

Is there anything actually written down in some kind of formal type format as to a standard for the R: lines in AX25 BBS's? I'm not looking for just word of mouth or gentlemens agreement on how to do it since that hasn't worked.

Basically I've noticed some differences here. Some systems will have the city/info section like city [info] , some will be [info] city, others have just a city, some [city] info, etc... Seems like everyone does it different. Normally I could care less about what is after the hierarchical address since I just use it for general info, but apparently the WP server does. On an R: line like mine where it has [IP TUNNEL] Roseville the WP server will take what's in the brackets and make that the city that I live in. Some programs have an info section and a QTH one for the R: line. The QTH is also used for things like BEACONS and other BBS stuff while the info is put in brackets. Usually if the program has an info option then it will put a [] in the R: line anyways. If you flip the QTH and ifo then it will just put out strange beacons over packet and you're more or less not even fixing a problem but are just trying to go around it.

I noticed that F6FBB program is putting the city in brackets and the FBB sig afterwards. Works for the WP server though.

How about making a standard to stick by and a few basic rules (like R: lines being limited to 79 characters when you are at your max amount of messages). Some people say the info doesn't belong. Well I have personally found them extremely helpful. It's usually only a few characters anyways.

There are only a few casual documents describing the exchange protocol
and header contents for the ham BBS network. There are conflicts
between those written by different authors - probably an outgrowth of
the independence of the authors of the software, and perhaps even a
leftover from the early days when some of the BBS writers were coding
FOR incompatability in an effort to force their way of doing things.

I am (as a background task, so don't hold your breath) attempting to
reconcile these various informal documents and come up with a standard
document that will describe a basic protocol that can be counted on to
work with nearly all existing BBS implementations, with the hope that
future BBS authors will be able to use it as a reference.

Right now, no such document exists.

As quoted from <9205231038.AA13885@chaos.eng.wayne.edu> by ron@chaos.eng.wayne.EDU (Ron Atkinson):

```
+---------------
|      I have absolutely no problems when an AX25 BBS forwards to a NOS
| system or mail comes in by  NNTP, SMTP, etc..., but since the BBS's can't
| handle existing world-wide standards, do we have to keep modifying the
| programs out there to follow non-standard practices that the AX25 BBS's
| are using?
+---------------
```

Try to remember that SMTP "Received:" lines were designed for somewhat larger systems than most PBBSes. "R:" lines are somewhat shorter than "Received:" lines... and with the number of them that can build up in a message, the space savings can be considerable.

But if you're griping about that, you might as well complain about Fido "SEEN-BY:", Usenet "Path:" and all the others as well.

```
+---------------
| because the BBS sysops's complain about the long headers.  The headers
| are there for AX25 forwarding too, but the software usually suppresses
| them. Why not suppress SMTP headers too and leave them alone?
+---------------
```

"R:" lines can be suppressed trivially: they're a single physical line.
"Received:" lines are often multiline.

MSYS 1.13, however, does suppress "Received:" lines.

```
+---------------
|      Also the BBS programs can't seem to read the SMTP headers. They are
| in a nice simple format and are very easy to read, so I don't see what's
| so hard about adding it into their code.  When I send a message for both
+---------------
```

NOS SMTP headers are okay, but anyone who's tried to write an RFC822 parser
that will handle the headers of any mailer on the Internet can tell you just
how mich of a nightmare it really is.

```
+---------------
| and always seems to get lost on the  hostname type formats. NOS can easily
| be modified to handle whatever format the AX25 systems decide on, but it
| should be a system that is upwardly compatible.
+---------------
```

NOS is designed for interoperability with Internet, NOT for PBBSes. The two
are vastly different environments in intent, and the implementation reflects
that. I don't seriously believe that we'll be seeing SMTP become the AX.25
message format standard.

Consider this while you're at it: more and more TNCs have personal mailboxes
with reverse forwarding, etc. The chances of a TNC running SMTP for this are
zero: it's too complex for the limited memory available in most TNCs.

I just purchased an MFJ TNC-2, which I'm using on a Mac IIsi with an FT-411e (employing "normal" off-the-shelf Mac-to-RS232 modem cable and an pre-made MFJ cable from TNC-to-411). Now the computer is communicating fine with the TNC, judging by the text display and acceptance of commands. Also, the DCD light goes on when a packet comes across the radio. But hitting the MONITOR command brings nothing to the screen. Can anyone explain what I might be doing wrong without actually seeing my setup? Thanks in advance...

If anyone knows how to get the HF side working on a MFJ1278, I'd sure like to hear about it. What should I be checking for? What is the Best Program to use with it. I just picked up Lan-link 1.59 But Not sure this is the best for this TNC. I got the VHF side working so far. TNX.

Rig here is a Kenwood 140s

-----> Note that Jean-Bernard Condat and the Chaos Computer Club France
work all the time for the diffusion of the packet-radio in the
beautiful country of France!

DON'T HESITATE TO FOLLOW TO OTHER BULLETIN BOARDS THROUGHOUT THE WORLD.

Juny 6th, 1991 6:24 pm

The French Police Judiciaire inculped of computer fraud (]462.2 of the
French legislation) Jean-Bernard Condat, general secretary of the Chaos
Computer Club France (cccf).

The police said that like an hackers club (72 members in France) and
1,800 correspondants throughout the world) cannot be legal and found a
crazy story of NUI (the well known BND2 code used from two years by all
the people via Minitel, the French terminal) and inculped Jean-Bernard
for paying US$1,000 pro month... "ad vita aeternam"!

The anniversary of this day, the CCCF make a great fest with a lot of
articles on computer haching, etc. Don't hesitate to collaborate and/or
send a message in this e-mail box for Jean-Bernard.

Thank for your help. Don't hesitate to put this e-mail address on your
mailing list... and to ask us for all your French questions.

Maybe you have the TNC set up expecting 300 baud (for HF reception), when
you want 1200 Baud (for VHF)? Or visa versa? (not familiar with the 411,
is it HF or VHF or UHF rig?) Or maybe you need to increase or decrease the
audio volume from your reciever (weak or distorted audio doesn't help decoding
any!). A first guess is to set the volume where you'd use it for voice work.
Hope this helps.   73s

For anyone who has not noticed, the The ARRL Repeater Directory,
1992-1993 Edition apparently left Maryland and DC out of the
Packet section. If you buy the $6 Guide, you better keep your old one
for an at least out dated listed of these.

I realize that this is a touchy subject for some, but is there anyone out there who has land-line forwarding working under g8bpq & w0rli? Or with NOS for that matter.

We have a strange set of geographical and political problems here, and the phone line is already here and working, and may provide an expedient if not totally ham radio solution.

Thanks in advance,

We would like to get any information from anyone out there that is
experimenting with 9600bps packet via fax boards. Things of interest
would be:

What radios have been used?
Were any mods done to the radios?
What fax boards were used?
What software was used?

We would really like to be able to run 9600 with KA9Q's NOS as tcp/ip is
the choice of protocols. Any and all info appreciated.

Please feel free to respond to the group or by e-mail. I will post
summary to the group.

Can anyone in this list please tell me where to mail order TCM3105 FSK modem i.
c. It is the one used in many TNC's and in BAYCOM modem.

BYCOM modem part list includes authors ID's DL8MBT and DG3RBU, and e-mail
addresses ohsnwq@oh3rbr.fin.eu and oh3nwq@nic.funet.fi. I tried both from
Bitnet and my message was not delivered.

Thanks.

Hi,

I have a project i would like to get started, but need some hardware
to make it work. I am trying to set up a packet slip line from my
QTH to work using a 56kbps packet slip line. I would like to run
BSD at home on a 486 box talking to a MIPS box at work, that has an
AT bus.

What i need to know is what hardware would be required to get the m/c's
talking at, say 56kbps or higher, over the radio. I am aware that we
would be required to write the drivers to use say a PI board on the 486
BSD box & the MIPS.

I would appreciate if you could let me know what hardware, in regards
to modems and interface cards, is available to allow us to get this
project off the ground.

any help appreciated.
tnx cul 73's de wayne

A local BBS sysop here is looking to replace MSYS with NOS + F6FBB
under G8BPQ. So far he has succeeded in getting F6FBB and BPQ integrated
and is trying to integrate NOS with BPQ on a second PC to get it all
checked out. What we want to know is, can the F6FBB BBS and NOS run in
two separate Desqview windows and communicate with one another via g8bpq
with "virtual" comm ports, ie, inside the PC without physically tying
up 2 serial ports for communications between the two programs?

Thanks in advance.

Please direct replies to viper!kc2ky

Hello!
       I'm trying to put together a packet station from scratch after getting interested in it through reading. My budget is tiny :-), so I've obtained a secondhand Commodore 64 and am aiming at getting licensed in November when the next Uk Radio Amateurs Exam happens. In the meantime I'm looking for the Digicom software and construction details/schematic for its associated Bell 202 modem.

Can anyone send these to me or post info on where they can be obtained by ftp or mail file-server? The C64 will soon have an RS232 interface and then C64/128 Kermit, so downloads should be possible.

I'm interested in TCP/IP but participation in AMPRNET will have to wait until PC prices go lower.

Thanks in Advance!
                  Steve Rudman

PS If I've assumed wrong and Digicom is *not* freely copyable for am rad purposes then the address of a dealer stocking it in the UK would be useful.

 Janet: "hooke::icarus::rudman" @ uk.ac.ox.atm.isams

Andy,
  Its a long time since I've run my MFJ TNC's in other than KISS mode
but I seem to remember that there was a command like MNONAX25 ON/OFF
that had some bearing on the MONITOR command. I just blew the dust
off my 1270B Manuals but I couldn't find the command mentioned in
there, but if you use the DISPLAY command or something like that it
will show you the command and its state, try swapping it ON/OFF, I
think, again from memory, that you had to turn it ON, to monitor
packets.

Following the growth of the number of BBS's in the Microsat satellite
Mail forwarding group there was a problem that arose in how users
got their mail sent to their nearest satellite gateway if they wanted
the message to go via satellite instead of via HF packet or Amtor.

As a result of this I wrote my version of the REQSAT server. There is
another version of REQSAT about written for the F6FBB BBS specifically
however my version should work with any BBS software that runs
a standard MBL type import/Export server function (eg W0RLI, AA4RE, WA7MBL,
F6FBB and others).

To use the server all users have to do is send a message to REQSAT @ the
station running the server and in the body of the message include a
second address line that is the final destination address. The server then
unwraps the message from the REQSAT header and re-addresses it to its
final destination.

While this software was designed primarily for use by the satellite gateways
it could be used by other systems that run wormholes so users can get
their mail sent to the nearest wormhole.

Till now I have only distributed the code via the satellites (which I dont
have direct access too) hence today I have uploaded it to two
AARNet/Internet sites.

For overseas users the REQSAT server program is available from:

tomcat.gsfc.nasa.gov in /public/bbs/reqsat24.zip

For Australian Users it is available from:

grivel.une.edu.au in /pub/ham-radio/incoming/reqsat24.zip

I hope to make a copy available on the UO-22 and AO-16 Microsats very
shortly. Comments on improvements people would like to see in the code are
most welcome.

Cheers de Grant VK5ZWI

For the past couple of years myself and Andrew VK5EX (who isn't on
AARNet/Internet) have been writing a RTTY BBS program with facilities
to be linked to the Packet BBS Mail network when run under a multitasking
program like DESQview on an IBM PC (or clone). We have released a couple of
earlier versions for general consumption but only distributed these by people
sending disks (we copied the code and mailed it back, a very slow
and time consuming process as you can imagine). Hence today I finally
have uploaded a copy of the program to two AARNet/Internet sites.

For overseas (ie not in Australia) users it is available on
tomcat.gsfc.nasa.gov via anonymous FTP as:

  /public/bbs/rttygate/rbb826a.exe

(small note here, the file rbb826.exe on tomcat is corrupt, I forgot to
set Binary mode before I started sending it!)

In Australia I have put it on grivel.une.edu.au as:

/pub/ham-radio/incoming/rbb826.exe

This is a self-extracting file for IBM-PC machines and compatibles.

Some of the features of RTTYGate are:

* No need for an expensive data controller. RTTY (Baudot) code is produced direct on the serial port. All thats needed is an Audio Modem.

* Various list command options

* Supports Packet Mail H-addressing for exported mail

* Users can ask the BBS to change speed

* The system is capable of running most popular speeds between 45 and 300 Baud.

There is a lot more in the program and a lot more planned. If you use RTTYGate and would like to see a particular feature included send me a message and I will add it to the wish list. RTTYGate is distributed FREE to all amateur radio operators. Comercial use is however strictly forbidden.

Cheers de Grant VK5ZWI Co-Author RTTYGate BBS v8.26

When ham packet BBS messages are sent, they are usually addressed to a general subject area and a general distribution. E.g., the send line is something like

    SB KEPS @ AMSAT

where the subject area (a primitive equivalent to a Usenet newsgroup) is "KEPS", and the distribution is "AMSAT".

Presumably BBSs will have forwarding lists that can be set to forward messages addressed to the distribution "AMSAT" to only those BBSs that want to see it. Of course, it is likely that the majority of these BBSs will forward all but a few such distributions to their neighbors; for example, I forward everything except a SDIEGO distribution to my neighbor BBS in Los Angeles.

However, some time in the past, it seems that an agreement was reached among a lot of the Southern California BBS Sysops that there were too many of these distribution designators, thus causing confusion and a maintenance problem for sysops. These sysops decided they would only forward a very few such distributions: ALLUS, ALLCA, ALLCAS, and a city and/or countywide one. All articles ("bulletins") entering one of those BBSs would have its distribution address field REWRITTEN to one of

the acceptable few.

This strikes me as a particularly short-sighted decision. However, not being familiar with early BBS software, it may have been a convenient method to simplify the maintenance of routing when dealing with stupid software.

The AA4RE BBS package (with which I am most familiar, of the various offerings) allows one to specify that distributions like "AMSAT" can be TREATED as e.g., "ALLUS", without rewriting the field in the address. Then the message can be distributed with much finer detail than can currently done: for example, a DXers' BBS can ask its neighbors not to feed it stuff from AMSAT.

This, to me, makes much more sense than rewriting the actual address.

Thus I think it's time for the people in my area to rethink their current addressing scheme, particularly the rewriting addresses part.

Comments?

The ALLUS/ALLCA, etc type of distribution scheme is also used here in Northern California and has been for many years. The rationale for this goes like this:

1) All packet BBS should carry the same bulletins. This prevents BBS DXing. Many years ago, it was common for a person to check into 5 or 6 BBS to see if there was an interesting bulletin to read that was not forwarded to the local BBS. By having everyone carry the same bulletins, a user need only check his local BBS.

2) Everybody sending bulletins wanted their own distribution code. @RACES, @AMSAT, @DX, @CHESS, @ARES, @ARRL, @TAPR, @nauseam. It was felt that the @xxxx should indicate the geographical area of

interest rather than the subject. Why is KEPS@AMSAT and KEPS@ARRL
different? Who cares which organization created the bulletin?
Won't the same people who read KEPS@AMSAT want KEPS@ARRL?

That was thinking. I think it was valid at the time and I haven't
seen anything to change that. Other comments?

As PAWEL did not have packet access (he is not a ham yet) a lot of
hams asked me to forward AX25DRV via packet network.
I send it but as many mail come back , most of bbs did not get it as I post
it using 7plus in 10Kb mails. So I ask from the hams that can forward it
to local BBS to do this so every one can get it.
Especialy in England if some one can forawrd it to G6WHL@GB7KLY or CLIVE@GB7KLY
as G4OYZ asked me to do this.
If it is possible send the version with SRC code so everyone can work
TCP/IP with a BAYCOM modem.

I've been looking over the KA9Q package for using IBM-PC-style
platforms for network routing, mail, etc. It occurs to me that one
thing that seems to be missing is the ability to run a telnet session
over a serial port, i.e. dialing in to a PC-AT from a remote site with generic

telecommunications software and getting a "telnet>" prompt, and then
being able to connect to other hosts.

I'd be interested in finding any software which accomplishes this.
Basically it would support 1-n serial ports and one Ethernet or other
network port (perhaps just another serial port running PPP or SLIP).
If nothing else, KA9Q can probably be modified to provide this
functionality, but I'd rather not duplicate effort if at all possible.

Can anyone provide me with any info? Thanks in advance.

I recently aquired a PMR rig for 2m conversion, which I have now
converted. I am planning to get my RAE in December, but I want to
use the rig now since I've got it working. Is it possible to
'listen' to packet. If so, I'll need a TNC, which one should I buy.
What's the frequency of packet on 2m, is it 144.650Mhz?

Answers to my questions would be greatly appreciated.

Thanks,

Andy.

I've argued for years that the To field should be used to designate subject areas, and the @ field for geographical distribution areas. I'm not convinced that organization names like AMSAT need to appear in either field. I wrote an article on the subject for Gateway several years ago, and there has been some minor improvement since then, most notably in reducing the proportion of bulletins addressed to ALL in the To field (Roy's BBS code has helped in that regard... do any other BBS programs attempt to dissuade users from sending bulletins to ALL?). I'm not optimistic that things will get much better in the PBBS network anarchy... that's why some people are implementing Usenet-like news systems as an alternative.

It's too bad that no group (such as the ARRL Digital Committee, perhaps?) has taken the bull by the horns and tried to set some standards for the way mail and bulletins should be handled in the PBBS network. Practical experience should precede the setting of standards, but by now we've had plenty of experience...

Since I've already answered this question several times directly to
various requestors....

I purchased some of these from Arrow Electronics a few months
ago. I think they have a minimum $ amount, and there is a
handling charge as well.

Their phone number is:

     1/800/932-7769

There may be cases where one BBS would want only AMSAT stuff, whilst another
might want only ARRL bulletins. True, the subject should be more informative,
but no two people can decide on a standard subject format, it seems. Also,
parsing the ARLxxxx is harder than @ARRL.

Do you know any source for the TMC3105 chip ?
(I mean that they have it in stock)
I need about (10) ten.
I prefer a source in USA.
I checked with Marshal Electronics.. They need 16-23 weeks for stocking.
I will appreciated e-mail answer.
Thanks

George P Alexiou

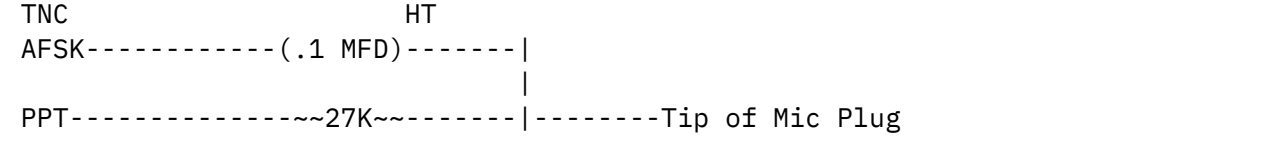
The Question:

     To: /tech/radio/amateurbb   Msg #: 223
   From: usr2836a (Larry Varney)   On: 03/01/92 08:53
Replies: 1
Subject: Packet

  I just picked up a MFJ-1270B, and now I want to connect it to my
Alinco DJ-160 hand-held. The manual has five wires coming out of the TNC,
and I have two points of connection on the HT: one little port for an
external speaker, and one for an external microphone. Now, I can pretty
well figure out where, from the TNC, Microphone Audio, and Receive Audio
should be connected. But I've also got Ground, Push-to-Talk, and Squelch
Input (which is described as optional). I can see that Ground might just
need to be connected to the base part of the plug wires, but where will



Push-to_Talk go? On the same wire as Microphone Audio?
  If any of you have done this before (how five wires are connected to
two plugs), I'd appreciate hearing about it.
  Tnx and '73,
  Larry KM4ZH

The answer:

____
     To: /tech/radio/amateurbb   Msg #: 224
   From: usr3235a (william j. simpson, jr.)   On: 03/01/92 12:04
  About: #223 (above)   Replies: 1
Subject: Re: Packet

Larry, the PPT line or "mic" input is the same as the "AFSK" input to your
TNC, the audio output on your HT is obviously the audio input to your TNC.

I am not very familiar with Alinco Products, but MOST HT's require isolating
the ground in the AFSK input. Usually the TIP of the connector is the AFSK
output, and the "ring" is the ground for the PPT. Typically using a .1 MFD
capacitor and approximately a 27K Ohm resistor in series is the interface
you'll need to use. Here's a schematic....

The audio circuit is probably strait forward enough to leave out of this
explaination. (Oh...if you find your "deviation is too high...that is
the audio level transmitted it to much, increase the size of the resistor, and
if its too low to be heard, decrease the size of the resistor.)

If you carefully pick the physical size of the cap and resistor, you can
easily fit them inside a minature phone plug.

Good luck, 73, Bill/KI4QJ usr3235a

The next question:

Is a similar procedure also necessary to connect an AEA PCB-88
to a Yaesu FT-411?

I have to run up to Rat Shack to get the miniplug anyway, so do I
also need to get the .1 microfahrad capacitor and the 27Kohm resistor
and the .1MFD cap goes on the bottom contact of the sub-mini and
the 27Kohm resistor on the tip contact?

           John

Has anybody ever suggested that the packet BBSes be replaced with
Netnews software instead of slowly but surely reinventing it from
scratch, with much pain and anguish along the way?

Never mind. I couldn't control myself. Sorry.

Don't feel too bad, I was asking this same question last year. I bought
the KAM, partially because of recommendations by other users, and
partially because Kantronics had a sponsored a seminar on digital radio.

On the "VHF" port, you can have several distinct packet connections at the same time (one RF frequency). You can also operate on the "HF port" in RTTY or AMTOR at the same time as the "VHF" connections. For example, if you were into DXing on RTTY, you could use the KAM to connect to the DX cluster for spotting while operating RTTY on the HF bands. I don't think the PK-232 will do this.

To keep things fair, on AMTOR, I 3 or 4 hams running the 232 for everyone I contact using a KAM.

I'm working on it. Or more specifically, I'm working on the basic mechanisms that would allow this service to be provided without a lot of ad-hockery.

Recently I've reimplemented the stdio (standard I/O) package as part of NOS. (Previously I had been using the stdio library provided as part of the regular Borland C++ library). The new stdio library allows you to use file stream functions (i.e., functions that operate on FILE * pointers) on network sockets, internal inter-thread pipes and the new terminal emulator. I will probably add support for serial ports fairly soon.

This means that pretty soon the various NOS commands can run pretty much without change on the local console, TCP connections or serial lines. And something like a telnet server (or modem server, which is really the inverse function) should then be pretty easy to implement.

Watch the code in ucsd.edu:/hamradio/packet/tcpip/ka9q. I'm updating
it on a regular basis, but since it's work in progress you should use
it at your own risk until I announce that it's stabilizing.

  A few weeks ago, while explaining the current amateur BBS arrangement
to a non-ham Unix developer friend, I made the observation that the
amateur community could do itself a big favor by ceasing to insist on
re-inventing a particularly painful wheel such as netnews.

  So, Phil, yes, I've suggested so. Of course, we know how must packeteers
will react.... rather than do something useful, they prefer to put up
another digipeater.

Call for Papers -- 11th Computer Networking Conference

The deadline for receipt of camera-ready papers for the 11th ARRL Amateur Radio Computer Networking Conference is September 21, 1992. Those planning to submit papers for this year's conference should contact Lori Weinberg at ARRL, 225 Main Street, Newington, CT 06111, tel 203-666-1541, fax 203-665-7531, for paper guidelines and/or an author's package. We'll need to know the topic of your paper and whether or not you plan on attending the conference.

Topics will include, but are not limited to, digital signal processing, digital speech, packet satellites, packet services, HF packet investigations, protocols, network development, future systems, hardware and software.

The 11th ARRL Amateur Radio Computer Networking Conference, hosted by the Radio Amateur Telecommunications Society, will be held at Fairleigh Dickinson University in Teaneck, New Jersey, this coming November 7.

Bill, I've been running the 1.1.8 release firmware in a MFJ-1270B off and
on for a few weeks and it seems to work just fine. Sounds like you have a
bad Eprom. Did you buy it from TAPR or burn your own like I did? I got
the firmware binary stuff from HamNet on Compuserve.

The above *does* work with a Standard HT and an AEA PK232... I tested it
today. The problem seems to be with the Ramsey kit. I am not very
happy with Ramsey about this.

I run a small BBS in Carbondale Illinois on an MSDOS system. I'd like to know what type of equipment would be necessary to connect my PC into a packet radio network, I've seen what appear to be packet radio email addresses on some Usenet posts I have seen (and listserv lists too) but need more info. About all I know is that it's 9600 baud and I think there's internet access too. I also know essentially nothing about ham radios, so any info you have would be appreciated. Please email rather than posting to the group as I'll be leaving sometime this week for about a month, and the articles at this site expire after two weeks.

My apologies if this is a FAQ.

It's not called Hamnet, but maybe he is thinking of the Fidonet Ham Radio echo. It is very similar to Usenet, but most of the machines are running MSDOS, and not Unix machines.

 Not really true. The modems in the software for the DSPCARD 3 does include
 a fractional-tap adaptive equalizer for 9600 bps G3RUH by Jarkko, OH2LNS.
 It has been working for about a year now. If anyone is interested in the
 implementation, the sources are freely available e.g. from funic.funet.fi
 /pub/ham/dsp/packet/sources.zip (I haven't checked, but they are probably
 also in tomcat.gsfc.nasa.gov and ucsd.edu). Twin modems for 9600 bps should
 be OK with 56001 since OH2LNS's code does also KISS and HDLC and they consume
 more horsepower than the modem itself.

I have heard that there is an EPROM replacement for the GLB PK1-L that
replaces the existing EPROM to convert this TNC to a Kiss TNC (only, I presume).
I'd like to know if this actually exists and if so, where I can get an image
of it.

Thanks,

VE3PGD

Hi Steve:

One of the great benefits of me doing this work for no royalties is that
I get to brag as far and wide as I like. I will not be compensated for
this work in any way other than my right to brag about it as loudly as
I like. I do not know why this seems so hard for people to believe.
You obviously missed my earlier posting, which I will spare the net.
I am mailing you a copy directly.

I am using my IC 32 E (European version) for packet radio for several years
now, and having LOTS of fun with it as a ""fixed"" station... Just remember
to switch off the power saver...

To connect my TNC2c to the transceiver, I use this little scheme:

I also have made some "tabs" in the transceiver to connect a VE3DNR/4k8
modem, though I haven't had time yet to try them... If there's someone
interested I'll post these things too...

Best regards, Ramon

As of a couple of months ago, GLB were denying it ever existed, and had
no plans to produce one. Perhaps someone has written one? I'd be interested!
It could make a fine KISS modem - it's certainly hopeless for its intended
application, and I believe it only supports V1.0 of AX.25 as well, despite
what GLB may claim.

Does anyone know how or if the MFJ-1270B tnc can be put into the host
mode. I am trying to run AA4RE's bbs program. I keep getting crit errors
like the tnc is not responding to the bb.exe file. I know my parameters
are set right because while the program is loading I am copying the
local packet transmissions. I am running this program on an IBM
compatible xt. I can run the tnc with my land line terminal program with
the same settings and it does fine. Can anyone help me with this. Any
help would be appreciated. Thanks and 73, Mark N5ORU.

I was wondering if the Alinco data radio's modulation occurs
inside of a PLL (like many voice rigs), or if it's done
outside the loop. I'm curious because I know that doing it
inside the loop can cause problems when trying to run at
9600 baud.   Can anyone out there relate some experiences
using this rig at 9600 baud?

Hi Kaj:

That is great news. The story on the HDLC and KISS cannot possibly be right.
I agree that they are pigs and use a lot of ticks, but they cannot consume more
total ticks than the 9600 bps modem. You might mean that their processing can
be deferred since they are the foreground task and that while they are running
they use most of the processor ticks but it should be clear that for most of
the time they are sitting idle waiting for the `HDLC has arrived' flag to go
up and then KISS only gets executed when HDLC says it received a valid frame.
The 9600 bps modem must be executed each and every sample time and can be deferred
only with great difficulty.

I am sorry I did not know about your equalizer modem.

Congratulations.

Bob

writes:

   Where exactly can I purchase the TAPR 9600 modem? Do they take VISA?

From TAPR. Since I orded last week I happen to have the number:
602-749-9479 and Fax: 602-749-5636. They took my VISA, not sure how
they handle foriegn orders.

   It's just that I want to work in TCP/IP and 1200 is far to slow! I have a
   Kenwood TM-241A - will it work with the modem?

To work with any radio you have to tap into the "guts". True FM
crystal radios are usually reccomended but with fiddling other
synthesized radios have been made to work. I don't know about that
one in particular.

good luck, jv

Hello netters:

I am not a radio person, though I respect those who use it and perhaps one day because it has many interesting possibilities!

I do have packet and SLIP connectivity to the internet and the Ka9q/NOS programs are outstanding.

Recently I picked up the latest and not latest wnos3.x variants. I compiled these programs using Borland C++ version 2.0. For some reason it would NOT compile under Borland C++ version 3.0. I had all the SLIP code but the attach asy command is not recognized. Compiled WNOS will accept an attach packet command, but I would like the SLIP ability to be usable. I have had other problems, too.

The screen is very cluttered and the text will not scroll properly, thus filling the screen with text.

I have some kind of router problem. the program asks for arfconv.exe but I cannot find this file on Archie or several of the NOS sites. It is frustrating.

I love this software and desire to use it or some variant of ka9q/NOS that does everything WNOS does. But the interface in WNOS is superior and I want to use it all the time. Can anyone help? Is there a pre-compiled version without the radio packet code and the slip code that allows an attach asy command? Is there an ftp site and files I can use? Can someone compile a version with SLIP and allow ftp or email in uuencoded format?

Please help, and thanks for anything anyone can do for me 8-)

Please reply to this address: joer@inca.law.csuohio.edu. My current node is a test site and not up all the time, or even most of the time.

Thanks again!
Joe

Recently it came to my attention that gb7tcp.ampr.org is recognised by our Internet name server and it gives the address as 44.131.whatever. Connection attempts fail (as expected) but it seems odd that the name server understands them if there isn't a gateway available. So my question is this: is it at all possible to connect to such a TCP/IP station from the Internet? If so, what are the licensing implications of this, especially from the point of view of a non-licensee such as myself?

I look forward to your replies.

Hello,

This is in response to a post a couple of weeks ago on connecting a TS-690 to a PK-232. This is the hook-up that I use. It works well for all the data modes. Page 22 of the Kenwood manual details the ACC2 connections and the PK-232 connections are found in its manual.

TS-690 ACC2	PK-232	
2	J7-4	FSK keying
3	J4-1	RX audio

4	J4-4	Audio ground
8	J7-2	FSK ground
9	J4-5	PTT
11	J4-2	TX audio

Notes:

1. On the PK-232 J4 is the Radio 1 port and J6 is the Radio 2 port. J4 and J6 can be used interchangeably.

2. I use the FSK for most of my digital communications. It allows me to use the narrow filter for digital. For an explaination, see page 38 in the Kenwood manual. I hooked up the TX audio in case I ever wanted to do AFSK.

******** WARNING ******* WARNING ******* WARNING ******* WARNING ********

YOU MUST!!!!! DISCONNECT THE PK-232 BEFORE USING SSB!!!!!

If you do use SSB with the TNC hooked-up, your SSB will be horribly distorted. I talked with a Kenwood technician about this, and the only solution so far is to disconnect the TNC.

******** WARNING ******* WARNING ******** WARNING ******* WARNING ********

DISCLAIMER: Anything you try with your TNC and your radios is your responsibility.

Let me know how things work out.

Lines: 57

Hello! Myself and a few others are looking for persons in the Chattanooga and Lookout Mtn TN/GA area who are doing TCP/IP now, plan to in the future, or just plain ol' curious about it.

We are aware of the WQ4B/LOM switch atop Lookout Mtn. on 145.09, and that it has a TCP/IP port on it, but we know nothing more about it. We would like to learn more about this switch, i.e., the TCP/IP frequencies and configuration, etc. Attempts to contact WQ4B via packet or the mails or Internet have been unsuccessful so far. Anyone else associated or acquainted with this effort is invited to contact us or let us know how we can call/write/E-mail you/them.

We manage a club station here at Middle TN State University (W4EFQ) which is growing and moving towards TCP/IP implementation, full Internet capabilities, and other such endeavors. We are very close with Dave, WB4LHO, and his efforts to run and enhance the TCP/IP switch atop Short Mountain (McMinnville/Warren Co.) TN, which serves into Nashville and reaches WQ4B's switch on Lookout Mtn. Information coming to us about the efforts of the GRAPES group in Atlanta and their 56K bps work have captured our interest and working with anyone, especially WQ4B/LOM or any group working out of that area would be a major step in linking a backbone up towards Nashville.

If you or anyone you know of has *any* information you could offer, please E-mail us at the following addresses:

Mark N4XHX: N4XHX@AB4ZB.#MIDTN.TN.USA packet,
            root@mjbtn.jobsoft.com OR csmjb@knuth.mtsu.edu <Internet>,
         MTSU Computer Science, PO Box 48, Murfreesboro TN 37132,
            615-893-0098 <work>.

John KD4EAI:KD4EAI@AB4ZB.#MIDTN.TN.USA packet,

Hi,

I am interested in getting into packet and so far all the info I've
been able to find here on the net about packet is VERY general and
VERY non-technical. I have some questions that hopefully someone
can answer for me.

1) I keep seeing references to packet modems while talking about
   TNC's. Is a separate modem needed in addition to a TNC?

2) What exactly does the TNC do and what are the different stages
   of processing.

3) I want a small portable setup and I want to be able to do 9600
   baud and be able to swap the ROMS if necessary. What TNC's are
   are available that provide these capabilities? (I want the newest,
   best etc. but small/portable).

4) Where can I find info on LEOS satellites?

5) What satellites are available on VHF/UHF?

6) How can I find out about store/forward BBS satellite systems?

7) Do you need a special TNC or equipment to access these satellites?
   (I am not interested in HF systems, only VHF and UHF)

Did I miss anything?

I am just getting started and only have access to the internet right
now. If you can help me with any of the answers please mail me or
let me know how to copy the answers off the net. Thanks for your
help....

A few of us were working on this a while back but got side-tracked and never
resumed. The big problem is that the PK1-L has no UART. All communication
(both on the serial and radio side) is done by polling the bits and timing
is done by counting the cycles in your code! So, needless to say, programming
is tedious and we sort of lost interest.

Hmm... in fact, there was something about KISS that made "real" KISS
impossible on the PK1-L. I forget what that feature is but any KISS that
would be made for it would be lacking. Perhaps it was the back-off timer?
I don't remember...

Speaking on behalf of the FAQ Coordinators, Mike's complaints are valid.
We would very much like additional technical information and pointers to
other references to "beef up" the FAQ. In addition to answering Mike's
questions, could those on the net "in the know" help make the FAQ more
useful by CC'ing the answers to packet-faq@uts.amdahl.com?

We are working on merging the submissions of the past 6 months or so,
and should have a new version out very soon now. We would very much
like to add your name to the acknowledgements list.

Welcome to the newsgroup and the net, Mike! I hope that we can offer
you the technical insight that you seek.

Several questions for the net...

Someone let me know if there is a better place to discuss the following
topics...

Does anyone know of any NOS packages that have been put together for
Unix (xenix, ultrix, etc...)??

What are the fastest speed radio modems that are available?

How feasible is it to "gateway" between an Ethernet and a TCP/IP'ish radio
network... neglect for the moment the FCC's restrictions regarding auto
forwarding via the airwaves... Say that this was going to be done on a
commercial frequency...

If you were going to create a "wan" using radio, would you use direct
links, that would be analogous to leased phone lines, or would you create
a TCP/IP network with packet radio, that would be more like a BIG Ethernet?

Why am I asking??? Several sites in this area are considering methods of
circumventing the phone co in setting up a WAN. One of the proposed methods
would be to get a commercial frequency, and use packet radio. The technology
would be similar to Amateur Packet, but would not have some of the same
restrictions.

In the long run, paying for all of this would probably be less expensive
than paying to use phone lines, especially if things could be done between
billing areas.

There are several problems that we know that we have to consider... like:

"How do you keep people from just adding themselves to the net?"
"How can you expect this to be anywhere near private?"
"How can you keeps this secure?"
etc...

Any and all thoughts would be appreciated. I can post a summary if people
email, but, I would guess that it wouldn't hurt to see some of the answers
just posted to the whole net, rather than emailed just to me.

Later.
Dan

Someone asking about NOS for Unix I think....there is a version of KA9Q NOS for
Unix floating about.....for the version of Unix which I use (Linux - a free
system V compatible Unix which runs X, etc. - just thought I'd give it a plug!)

you can find it on places like tsx-11.mit.edu (in the subdirectories of
/pub/os/linux) and puffin.doc.ic.ac.uk. Hope this helps,

  "Procomm Modification For Packet."

Greetings packet users with procomm. Here is a really neat
mod that you can perform on your Procomm Communications Program.
This mod will allow you to use your modem dialing directory as
a connect directory, which will allow you to use quick keys when
connecting to your favorite packet station.

Go into the modem setup screen and delete the modem init. string.
Next, delete the modem dial cmd and replace it with ^C.
Then delete the dial cmd suffix and replace it with ^M.
That is ^C   and   ^M   there are no periods after the command.
Once that is complete you hit ESC and choose save to disk as
the option.

Finally, go to the modem dialing directory by using ALT/D and
start revising the directory. Where it calls for the name of the
pbbs just give it a name that is suitable for you. When it asks for
the telephone number, simply put the letter C [space] callsign and
ssid number. Ex: C N2XXX-4 and then the hard part is over. The
is to put E71 and choose if you want echo or not.

This mods works with Procomm ver.2.4.2 and Procomm Plus however, it
should work for modem programs like Telix and other alike.
73 de Jim ..._._

Hi Mike,

I'm not a real expert, but I've played a little with packet on VHF and
HF. I'll take a cut at some of your questions...

>1) I keep seeing references to packet modems while talking about
>   TNC's. Is a separate modem needed in addition to a TNC?

Logically the modem and tnc are separate units. Most tnc products
include a modem for 1200 baud and lower speeds. For higher speeds
modems are usually add-ons. There are a couple of software-based
systems, Baycom and Poor Man's Packet for IBM and Digicom for
Commodore, that require only a modem and do the tnc job in software.

>2) What exactly does the TNC do and what are the different stages
>   of processing.

The main job of the TNC is the OSI data-link level, taking a stream of
bits and assembling them into packets or vice-versa. The modem takes
care of the OSI physical level. Most TNCs do only this when in KISS
(Keep it simple..) mode, but by default do quite a bit of additional
work, so that a simple dumb terminal program is adequate to handle
communications and control packet functions -- you normally don't see
the headers of packets or handshaking packets or packets not addressed
to you.

>3) I want a small portable setup and I want to be able to do 9600
>   baud and be able to swap the ROMS if necessary. What TNC's are
>   are available that provide these capabilities? (I want the newest,
>   best etc. but small/portable).

Here I can't help you -- I have used the Kantronics KAM, it's not big, but
I know there are much more compact units that are better matches to
handheld transceivers.

>4) Where can I find info on LEOS satellites?
>5) What satellites are available on VHF/UHF?
>6) How can I find out about store/forward BBS satellite systems?
>7) Do you need a special TNC or equipment to access these satellites?
>   (I am not interested in HF systems, only VHF and UHF)

For the satellite questions see the ARRL Satellite Experimenters
Handbook. There is not a lot on digital modes, but there is some basic
info. This is not something I have experience with (yet -- I have plans!)
but my sense is that there are no special techniques used, basically
these are orbiting bulletin board systems.

For up to date info on availability of satellites and tracking data, bulletins
are frequently posted on rec.radio.amateur.misc, and also on local packet
bulletin board systems.
If you are interested in serious non-amateur use of LEOSatellites you
might want to contact Volunteers for International Technical Assistance
(VITA) in Washington. They are very involved in promotion of low-orbit
store and forward communications for Third-World development projects.
They can be contacted at vita@gmuvax.bitnet.

Hi,

I don t believe there are any commercial frequencies above 30 Mhz and below
900 Mhz for the purpose u envision. These allocations are for Land-Mobile,

and using them for communicating between "Bases" is not correct. Sure, it happens, but its not going to be endorsed by the FCC.

Why is that important ? Well it has allot of implications as to the radio system design. How far a radio system can work, is directly related to the size of the antenna. A large antenna in this spectrum, is relatively simple, and can be made omni directional. A large antenna at frequencies above this spectrum is probably going to be unidirectional, a "beam" in other words.

There s a possibility of doing "Point-MultiPoint" in the spectrum between 900 and about 1800 Mhz, but recent international allocation stuff is making that a doubtful proposition. I think Motorola is doing something like this, with T1 data rates, but don t know the details. Basically the subscriber puts up a beam pointed at the T1 switch station, which is omnidirectional. This is not exactly what u are looking for. Right? Since instead of the phone company, u got Motorola to pay. What s the diff? I m not even sure they use IP protocoll.

So, these things basically constrain ur system to a point-point scheme, if ur thinking of doing it urselves. The idea of a big Ethernet just is not practical on commercial radio , executed by the users alone.

WAN is an imprecise term. With the great differences in ranges of individual radio circuits, u really can t define WAN from the "Ethernet/ Unix" user point of view, as everybody in one building. On radio a LAN is any channel where ALL the users can communicate directly, with no other switch equipment inbetween. A WAN then would be any network where the data has to tansvers a switch, and usually end up on another radio channel, some distance away. Lan s can thus very from ones surrounding neighborhood, to a Metropolitan area coverage system, to a mountain top based repeater supported system that covers several states. The real guiding prinicipal about selecting a LAN size is how much thruput is needed. In the metropolitan areas LAN s need to be small, on the order of 10 miles diameter. From ur note, it seems u are interested in linking wire line LAN s together by Radio, not having the LAN on radio. In which case, the Point-point scheme has no real problems. If however u wish to have the LAN on radio as well, then the commercial spectrum is really not well suited. Oops, the second use of WAN in this paragraph should read LAN .

Hello!
       I'm trying to put together a packet station from scratch after getting interested in it through reading. My budget is tiny :-), so I've obtained a secondhand Commodore 64 and am aiming at getting licensed in November when the next Uk Radio Amateurs Exam happens. In the meantime I'm looking for the Digicom software and construction details/schematic for its associated Bell 202 modem.

Can anyone send these to me or post info on where they can be obtained by ftp or mail file-server? The C64 will soon have an RS232 interface and then C64/128 Kermit, so downloads should be possible.

I'm interested in TCP/IP but participation in AMPRNET will have to wait until PC prices go lower.

Thanks in Advance!
                  Steve Rudman

PS If I've assumed wrong and Digicom is *not* freely copyable for am rad purposes then the address of a dealer stocking it in the UK would be useful.

 Janet: "hooke::icarus::rudman" @ uk.ac.ox.atm.isams

Help! I am looking for more information on the 430 MHz 56 kbaud CELLNET prototype station used between Napierville and Aurora IL. I have already downloaded the file from tomcat but need more information, particularly on the PacketTEN 5port Stand-Alone NosInABox.

So if wb9mjn, k9vxw, n4pcr, or anyone else with access to the project could get back to me with a little more information, maybe I could this part of Indiana out it's political and geographical black hole.

Thanks,

Hello,

I've recently acquired my first packet device, Baymod-9, the 1200-baud_modem_in_a_DB-9-shell device, and am running the Baycom terminal package, all from Paccomm. My experience so far has been good, (the packaging of the Baymod-9 is a little cheesy) and I like the Baymod software. What we haven't been able to get running on this modem is KA9Q NOS with the AX25.com packet driver written by Pawel Jolocha. Seems there's a problem receiving TCP/IP packets on the serial port. The machine is a Zenith MinisPort...we have considered the possibility that the machine's port is too slow, but we tried a faster Zenith too. Any ideas?

N9LKL,
John

ARP publish is also known as proxy ARP. For example, I have 3 boxes on an
Ethernet: AT, SX, and DX. AT has two radios on it. So that other users
don't need a specific route to get to SX and DX, AT has two arp publish
entries:

arp publish sx.wb5bbw.ampr.org ax25 wb5bbw-8
arp publish dx.wb5bbw.ampr.org ax25 wb5bbw-8

Now, when soneone ARP requests sx.wb5bbw.ampr.org, my AT blasts out an ARP reply with AT's AX.25 callsign. When AT gets a packet for SX or DX, he sends it over the Ethernet link. Neat, hah?
  Unfortunatley, ARP proxt canbe misuses. RIP ought to help out, but it is a quick and dirty fix. In entering this tome, I realize that if someone tries to get to SX or DX from the other radio, it'll not work. But there's not too many folks over there anyway..... 8-}

What is the modulation scheme used for 2400bps packet? Since Kantronics,
MFJ etc all have compatible hardware, I would guess it's a common chip
such as used for V.22bis? My KPC-2400 just has a Kantronics part ID on
the modem chip.

Speaking of Kantronics, what is the microprocessor used? Looks like
a "6303" or something - I've never heard of it, but I believe it has
a built-in UART etc, and possibly other "smarts" too.

Well Karen, welcome to computers... HamNet has been in existence since the early 80's using Compuserve "go hamnet" and is in existence on General Electric (GEnie) "radio". Join in and have fun, we have for many years.

1) Adding yourself to a net is just like adding yourself to any other meeting roster - someone must approve it. If you call any network - packet, CIS, Internet, etc. - you should have a proper password and user id. If the host doesn't recognize you, you don't exist in the net.

2) Privacy can only be accomplished - over the air - by encoding your data. While this may slow things down, you could experiment with sub carriers and encryption digitizing. Seeing how the military can encrypt data for secure radio nets, it seems that a civilian equivalent may exist.

3) See 2).

If your WAN is line of sight, and you are going to use a commercial license - which is needed to encrypt the data - then you might want to look at microwave of UHF. One site must act as server, and should have an antenna dish pointed to each remote site. The transmissions can be a tight beam which has little side emmission, thus a low possibility of interception. The higher the frequency of your carrier, the faster your modem can be. If you run high enough, you could use multiple sub carriers, switching one or more on a regular or irregular basis. If you use microwave, simple encryption can be used, as the transmission would be a very tight beam and quite difficult to intercept.

Karen.... as well as Compu$erve and GEnie, there is a Ham Radio Club on America Online too! At last count we had over 500 hams, swlers, scanner users as electronics enthusiasts registered. Lots of files in our libraries too.

All you need is a PC (or any DOS machine), a Mac or and an Apple //e and the
software is FREE. Call 1-800-227-6364 Ext 5254 to get the software. I am not
too biased... but AOL is a LOT friendlier to use if you have ANY experience
with a GUI (graphics user interface)... I have a Mac.

If you would rather send me your address via private e-mail. I'll have the
software mailed right to you directly.

Just a followup on my posting about Ramsey Electronics:

    1) I have gotten no positive reports about Ramsey kits. In fact,
there was only *one* response to my original posting, and it was also negative
and from a guy who had bought one of Ramsey's VHF transceiver kits.

    2) In hindsight, the Ramsey kits are ridiculously overpriced for what
you get in the way of the quality of the circuit design and the documentation.
For example, the VHF transceiver kits run $180 to $190 for a *kit* which you
have to assemble, debug and which have only 10 diode-programmable frequencies,
compared to $230 or so for an Alinco "data radio" which is assembled and has
synthesized tuning. (don't let anybody tell you that it "costs" more to put out
a kit... think about it.)

    3) The Ramsey packet modem kit cost me $70 on a Dayton "special".
It is basically a Baycom circuit with little documentation other than assembly
instructions. You can get Baycom "kits" for $40, and the Baycom documentation

goes much farther to explain to you how to get on the air.

4) And whatever you do, don't *assemble* your Ramsey kit. They won't give you a refund in that case. :-) (although I haven't given up yet!)

I wish that somebody had warned *me* about Ramsey before I plunked down my $70. sigh.

I'm wanting to send digitally encoded data over the air. Typical bit rate might be around 70KHz - 120KHz. Since I'm very new to this, there are several questions that I need to know.

1) What is the best type of encoding to use? i.e. Manchester, B8ZS, etc...

2) What's the best/easiest modulation method? i.e. FSK, QPSK, FM, etc...

3) What frequencies are legal to use for short distances? (about 100 yards max - just like a garage door opener)

4) What is the power level needed to do the above at the rated freq?

5) What are some semi-counductors that would do the above?

6) Any other points that I have overlooked or might overlook?

Thanks in advance... PLEASE e-mail to the address below. I have rare opportunities to get these news groups.

Hello group.

I have a few questions about WNOS that I hope someone can answer
for me.

(1) Does the attach scc in WNOS3B1 support the PI board? If so, do
both channels work?

(2) I notice that WNOS3B1 sees extended memory and reports it when
the memory status command is invoked. Does WNOS3B1 use the extended
memory? If so, for what?

(3) Is there a copy of WNOS4 at any anonymous FTP sites in the USA?

Thanks in advance.

  The protocol used depends on which company they buy the MDT
from. Each has it's own protocol and they are not a "standard"
type protocol. They can be on any of the normal frequencies, but
most I have seen are now using the 800 meg range.

AL N1AL replies to a previous posting, which in the name of brevity is
not included with:

>If you send packet through a voice repeater (or any other repeater that
>does not decode the packet and then reconstruct it before transmission),
>then I believe it would qualify as a "repeater" by FCC's definition.

Al, then I would assume by this that you would consider a "normal" (sic)
packet node/digipeater that DOES decode and then retransmit the packet to
NOT qualify as a "repeater" by the FCC's definition?

If that is the case... let's say that I took one of these new simplex
VOICE repeaters.. you know.. the ones that digitize the voice, store it
in memory, and then play it back as soon as the person talking dekeys, to
also not qualify as a "repeater" under the FCC's definition? After all,
it is really doing the same thing that a "digipeater" is doing right?

Taking this one step further.. let's say that we take one of the above
systems, and hook it up to a full duplex voice repeater.

1. The audio comes in. It runs through an A/D process and is turned
   into "bits" and is stored in RAM.
2. 100 milliseconds later, this data is fed back to a D/A and is restored
   to analog form (i.e. AUDIO) and is fed to the repeater transmitter.

Now we have a voice system that takes a voice... encodes it, throws in a
time delay, decodes it, and retransmits it... this system seems to be to
me, identical to what a "digipeater" does, and yet maybe then IT might not
qualify as a "repeater" by the FCC's definition either?   Ummm... Ahhhh....

I know that it is not advantageous to argue that a "digipeater" is
automatically retransmitting, as it opens up a whole can of worms, but
logically it seems to me that the matter of "decoding and reconstruction"
is a pretty weak point to base a discussion on whether a "digi" is really
a repeater or not.   No flames intended... show me the error of my ways.

I am having a problem getting my W2A to transmit while connected to my
PK232. I bought the cable from AEA and it seems to be connected properly,
but I'm not sure that the PK232 is putting out the right PTT signals. If I
have the 232 setup for positive PTT then I get about .1 volt between ground
and the PTT line (pins 4 and 5 on the connector) during receive and -.1
volts during transmit. If I go to negative PTT then its 0 volts during
receive and 1.3 volts during transmit. I think that either one of the
diodes or a transistor has gone bad. I have the service manual with the
diagrams, but it has been a few years since I have done any circuit
analysis. I would appreciate any help that I can get on this. Also, if
you have a PK232 and would be willing to take the above reading for me on
your working 232, I would appreciate it.

I have started posting the packet-FAQ again after some prodding from
Paul Schleck and others. I am now setting up auto-posting
for the Packet FAQ. Updates should occur on the 1st & 15th of each
month.

No changes have been made to the FAQ since November 1991.
However, I have not lost all the information/corrections that
have been sent to me. They will get applied soon.

Another option for using the PI card with versions of NOS which lack the
built-in driver: if it has packet driver support compiled in (most versions
do, it seems), you can use the PI packet driver instead. The latest release
can be found in pi_dvr3.zip, on hydra.carleton.ca or ucsd.edu.

 Yes still struggling with ka9q, latest problem:

 Unable to use netrom node to digi a tcpip connection.
Thanks to wd6ehr have setup the "netrom ...", "route ..." & "arp ..." to get
ka9q to transmit the packet thru the netrom node. However the tcpip station
on the other end never responds. The trace of the packet shows the ip
section with the correct ip # for the other end but my ip # is 0.0.0.0 and
i suspect thats the problem. Anyone verify that my ip # should not be 0.0.0.0?
And even better yet what am i missing in autoexec that gives me zero's?
 Spent some time in the source trying figure out where the 0's come from but
its not imediately obvious. As an alternate can someone give me some pointers
on where to look in the source? Now where is phil when you need him :-)
hmmmm oh yes still hoping netrom will go away.
Unfortunately i think its the only way for me to get out of the valley :-(.
 FYI if i can connect direct i have no problems with tcpip its thru the
netrom node that things get one way :-(.

As with any law, there are going to be grey areas. I think your example
still qualifies as a repeater. The reason it is different than the
packet digipeater is that in your example, the retransmitted signal is a
reconstruction of the actual modulation of the original. If there is
distortion on the original signal, it will be retransmitted with the
distortion intact. If effect, you have just changed the modulation
mode -- from analog to digital and back again.

The packet digipeater actually decodes the packet down to the raw information
level. If there is distortion on the original signal, it is removed.
In fact, the data rate of the output doesn't even have to equal the rate
of the input. The voice equivalent would be to have a speech-recognition

system that decodes the words (say into an ASCII file) and then uses
a voice encoder to regenerate the message.

Or, to use currently available technology, the voice equivalent would be
to have a human decode the message and read it back on another frequency.
(In other words, traffic handling.)

    In addition to the proprietary data format most state/federal law
enforcement agencies which manage the typical law enforcement data networks
require that if an agency is going to tie in their MDT system with the
state/federal database network, the RF link for the MDTs MUST be encrypted.

There's nothing in the definition of "repeater" in the rules that says a repeater can't have a time delay or how long the delay can be. It just says:

(97.3a24) "Repeater. An amateur station that automatically retransmits the signals of other stations."

>A digipeater does the same thing an old-time traffic handler does.
>It receives the message (packet), stores it, and re-sends it later.
>I believe that the FCC definition of "repeater" no more applies to
>packet digipeaters than it would to traffic handlers.

Old-time traffic handlers don't "automatically retransmit". The rules don't say that it how much delay there is going thru the (audio or digital) repeater, or whether the signals are modified going thru the repeater (such as adding a PL on the output, filtering out audio below 300 hz or above 3000 hz, setting the digipeated bit in a packet, etc), they don't say you can't convert the audio signal to digital and back to audio again.

I was recently given a Baycom Packet Modem. The device appears to have never been used and the diskette that came with it contains some documentation files.

A 4 wire telephone cable with a modular telephone plug on one end and open wires on the other end was supplied with the modem. The documentation from the diskette does not mention how to wire these 4 leads to control the earphone, microphone and PTT of the radio.

If anyone has the information about connecting this device to a radio (I plan to use a Yaesu FT-470) please email to me at:

glapin@nwu.edu

Thanks es 73,

Greg Lapin, KD9AZ

I managed to get my packet station to run NET/Mac, but I'm a bit
disappointed with the speed. I can't tell if I have the TNC (a
Kantronics) set wrong or if that's the way things are. Anyone have
suggestions?

My AUTOEXEC.NET file sets the parameters as follows:

```
param ax0 1 30        <-- TXDELAY = .3 second
param ax0 2 100       <-- PERSISTENCE = 100
para rax0 3 10        <-- SLOTTIME = .1 second
param ax0 4 3         <-- ?  What are these last two?  They were in
param ax0 5 0         <-- ?  the AUTOEXEC.NET file when I received it.
```

When I receive a packet from another node, my system waits between 5 and
20 seconds before sending an ACK. Is that delay because I have the
parameters set wrong, or is that delay a *feature* to keep me from
hogging the channel? Or is some piece of equipment or algorithm SLOW?

And if anyone who's put a Mac on TCP/IP would like to give me any
other hints, I'd much appreciate it.   Thanks.

If you want to get REALLY picky, a digipeater does NOT just retransmit
the data as received. It sets a single bit in the address fields saying
that it (the digi) has successfully received and digipeated the packet.

Bob

This is the way we screw our mailer.

Hi Greg,

 You connect a 2.2k Resistor for the push-to-talk and a .01 cap. for the
mike audio to the tip of the Mike Plug. That should work just fine..

I read some messages on UO-22 (or 14?) which indicated that it's been done.
But there were complaints that the async interface, running at 9600 baud,
was slow to empty the PK232 buffers, leading to some frustrating xmit
delays. But, I have no personal experience to relate. I run my MFJ1270b
at 19.2kb and have no complaints (save the faulty MFJ kiss implementation;
use tapr 1.1.7b instead).

David, while I don't have a ts690, I do have a ts440s interfaced via the
ACC2 jack. What I found, was that by tieing the tnc's PTT output to both
the mike mute as well as radio ptt, I was muting the audio fed into the
ACC2 jack. I had to use diode isolators to make it work right. Could
this be your problem?

An off the wall question...

I'm considering the purchase of a TNC. I would like to go DSP,
but am concerned about the cost. I can more easily justify the
cost (and slow down my racing pulse!) if I can find more than
one use for the DSP portion of the TNC. The final Jeopardy
question...

  Can I use the DSP portion of the AEA or Grace unit for vanilla
  audio processing? Are there input/output filters to be disabled
  or circumvented? Can the sampling rates be adjusted? What is
  the resolution?

Well, that was four questions. I might want to try voice or, gasp,
music processing/synthesis with the DSP as well as push bits into
the ether.

Hi Fred. tcp/ip is alive and well in Chicago. Welcome back
(almost). There are about a zillion modifications of the

original ka9q net program. I run PA0GRI (grinos) ver. 2.0j
which offers a split screen ability. I also like wnos3.0
but it has some shortcomings. Since all my internet access
is via packet, I can't ftp but there are several sources
around Chicago.

 JJP> implementation;
 JJP> use tapr 1.1.7b instead).

 Hi James. I just read your message about you running at 19.2k with an
MFJ-1270B. How are you doing this?? What are you using for a Radio?? What
modems
are you using???

 We are about to start testing with 9600 baud G3RUH Modems with MFJ-1270
tnc and commerical radios... I was wondering if you had any suggestion or
ideas?

 You also mentioned about getting rid of the MFJ kiss and go with the
TAPR 1.1.7B code.. How did you do this?? Did you order the chip?? Do you
have
the code on disk???

 We are going to try and develop a 9600 UHF Backbone link from here to

texas
with a little luck..

Any Help on Radios that work or ANYTHING, PLEASE SEND IT!!

73 de Angelo

Ofcourse only police could possibly be skilled enough to
use these mdt's (gawd i hate to think what they cost us in
tax dollars) but does anyone know if theres a reasonably
inexpensive version for our mobile use? (yea i know, get a
cheap laptop) seriously, does anyone know of a small dumb
type terminal for mobile use? Surely somewhere in asia they
muse be made. ?

tnx in advance, johnd

(ofcourse, i'll make my spouse drive while i type. 8-))

Comparing digital repeaters of _any_ sort with voice repeaters is like comparing apples with orangutans - other than their both being organic, they have little in common, and rules that make perfect sense for the one (i.e. an apple a day keeps the Doctor away, but may be harmful to those sensitive to alar) make little sense when applied to the other. (I understand that orangutans protest most vehemently while being consumed)

This is why the FCC is rewriting rules pertaining to amateur packet.

We've opened a whole new can of worms, and the old rules, intended for CW, live operators, NBFM voice repeaters, HF SSB operators, ATV, live RTTY, etc., don't make a lot of sense when applied to digital networking systems. That is why you all (well - MOST of you) have sensible, valid points, yet unequivocally contradict one another.

I'm OK - you're so-so; but the rules stink on ice.

Hello!
       I'm trying to put together a packet station from scratch after getting interested in it through reading. My budget is tiny :-), so I've obtained a secondhand Commodore 64 and am aiming at getting licensed in November when the next Uk Radio Amateurs Exam happens. In the meantime I'm looking for the Digicom software and construction details/schematic for its associated Bell 202 modem.

Can anyone send these to me or post info on where they can be obtained by ftp or mail file-server? The C64 will soon have an RS232 interface and then C64/128 Kermit, so downloads should be possible.

I'm interested in TCP/IP but participation in AMPRNET will have to wait until PC prices go lower.

Thanks in Advance!
                  Steve Rudman

PS If I've assumed wrong and Digicom is *not* freely copyable for am rad purposes then the address of a dealer stocking it in the UK would be useful.

Well, old Mr. Klutz here is trying his unsteady hand at assembling
a Ramsey FX-440! I'm still trying to find the Heath-style lug strips
and tube socket pins, but seriously, folks, it's a clever design. The
receiver is based around the Motorola MC3335 dual conversion chip.
That's a step up, they claim, from the older MC3359 in the older kits.

Anyway, I see that this new kit has a neat feature. Not only does
it have a 5-pin DIN packet connector (as well as mic and speaker
jacks), but it has three different output options. One is the
speaker output, just the thing for your old 1200 bps slow modems
and TNCs. One is the raw discriminator, just the thing for your
existing packet modems. The third is FSK demodulated by the 3335!
Ramsey claims (this using a Murata "F" i-f filter, maybe 16 kHz)
that it'll work to 35000 bps, though 9600 seems a design center.

Has anyone tried this? The transmit side is direct FM applied to the
VCO, so it probably has a low-end cutoff caused by the synthesizer loop
bandwidth, but given HDLC at even 1200 bps, that probably won't break
it, though they don't tell you the loop characteristics. The main
issue is that there's no scrambling, but then HDLC and NRZI do a little
on their own.

For under $200, modem included, this could be a great bargain for
packeteers. If you don't get burned (literally) trying to solder it
together, and if it works as well as I'd like it to.

The latest version is 1.1.7b and you can 'FTP' it from tomcat.gsfc.nasa.gov. It's in the tapr directory as a ZIP file. You'll need an EPROM programmer of course...

I'm trying to hook up TAPR's new 9600 BAUD modem kit to a TNC-1. The manual states that connection to a TNC-1 requires a modification in the switching logic by using different chips on the modem. When I called TAPR today I was told that the chips to be used with the TNC-1 aren't available yet (and may not be for a while).

I'm curious though. What kinds of differences exist between the modem signalling on a TNC-1 and that of a TNC-2 (which the new modem kit was designed for)? I thought the modem disconnect headers were essentially the same on both models?

Hi. I know nothing about Ham radios, I'm inquiring for a
person who doesn't have access to this net (yet).

He's heard of something like a computer network for Ham
radio operators. I've yet to find anything of the sort!
Anyone out there have any clue as to what he's talking about?

Thanks

Karen

From article <91541@siemens.siemens.com>, by pjd@cadillac.siemens.com (dr. funk):
>
> An off the wall question...
>
>   Can I use the DSP portion of the AEA or Grace unit for vanilla
>   audio processing? Are there input/output filters to be disabled
>   or circumvented? Can the sampling rates be adjusted? What is
>   the resolution?
>

Dr. Funk:

The AEA box has programmable filters and sampling rates. One of the modems uses 78000 or so samples per second and the filters will stand Nyquist rates up to 150 Khz. If that is fast enough for your applications, then the answer is yes. Since the unit is designed for `everyman' doing modem jobs, the filtering jobs you want done will be for online download to the DSP box initially. We are nearing full on the 27C512 and will soon have to go to the 27C1023. When we do this, FILTER will be an operational mode, and you will be given a menu of filters, etc to choose from. For the time being, the QLOAD command will allow you to download these filters to the processor. I will put a bunch of them on the AEA BBS if I can get a list. W3VH is supposed to be getting together a list that EME'ers will like, I am doing the standard notch filters, narrow nonringing bandpass filters for morse, etc. As soon as I get a list of these things together, I will make a library of these things and post them with operational instructions on the AEA BBS. In general, all new modems, filters, etc. will be available free of charge for download from the AEA BBS. Now that I have said all of this, I cannot remember the number of the BBS!

Howdy:

I have been on a roll of late. The KAM killers are done. I delivered
to AEA all the dual port modems they wanted and am now working on a
couple they didn't ask for, and then finally I will attempt the ones
that are probably not doable.

The DSP2232 now does

dual port VHF/VHF Packet
dual port VHF/HF   packet
dual port Baudot   / VHF packet
dual port AMTOR   / VHF packet
etc. All the ones KAM claims in its ads that it alone does.
I am doing some it is not (yet) capable of

dual port 2400/VHF Packet (this is V26B and I will call it that)
dual port V26B/HF packet
dual port Baudot/V26B
dual port AMTOR/V26B.

The ones I think MIGHT be possible, but have not yet attempted include

dual port G3RUH/G3RUH (or K9NG/K9NG 9600 bps if you prefer).

This requires a note. My 9600 bps modem in the DSP1232/DSP2232 are
the ONLY 9600 bps modems with an adaptive equalizer on the receive side.
It adapts quickly enough to use it locally on my 9600 bps bulletins
boards and digi/nodes. These guys are running txd's around 20ms
and the thing adapts quickly enough to easily handle that. I will describe
the thing in detail in another forum. (Thank goodness K9NG had the
foresight to use a scrambler). The eye pattern is displayed on the
tuning LED's on the front panel on all my modems (the one with two
data states), and the G3RUH lights two LED's with a BIG black hole
in the middle. This signifies the opening of the eye with the
adaptive equalizer. Why did I do this? UOSAT left the UO22 transmitter
in a mess. It is badly distorted as the transmitter spectrum has a
well at DC. The eye patterns in the raw signal are 50% shut. This
is enough to recover timing but is trouble when the signal gets much below
loud. This adaptive equalizer opens the eye more than enough for me
to get 5 times the copy of the old modem (not only myself but KA2MOV,
KE7GH, and N6KK report similar results) and at my location it reads
about 15% more than my NB96 (G3RUH by PacComm). The reason for the
detail about this is that this will be the thing that goes first
when I run out of processor ticks trying to do the dual port 9600's.
If I am required to do this, it will be clearly stated that you must
use decent radios, with reasonably equalized signals out of the

discriminator for it to work well.

Someone put a note on here about doing V.29 through a microphone jack with a telephone modem chip. That served as a major impetus to try it. If a chip designed to do this on a telephone wire can do it, I can beat it with the DSP2232, and will attempt to do so. It would be nice to do 9600 through the mike jack rather than off the discriminator.

I have completely revamped the WEFAX, and SSTV modems. WOW! I wrote an application for the PC that takes WEFAX DSP2232 output and displays it. 600 pixels per line, no timing information is encoded so the picture slides and phasing must be maintained for now with the help of your finger on cursor keys. Never mind, the charts and weather pictures coming out at 16 shades of grey(more than they encode originally, just convenient) are outstanding!! I can't wait for Steve (N6IA) to get his new analog mode done so that I can get the SSTV stuff on the screen. The demodulated waveforms on the oscilloscope look great but we need this mode for it all to hang together. This will transmit and receive. The unit is now fully rated at 38400 bps on the serial line to the computer BIDIRECTIONAL. I have written a terminal emulator and display software (my first big assembler programs ever) and it all seems to glue togther. This is too exciting.

Bob

The qusetions a bit vague, but you've found one of the discussion
groups (USENET / INTENET /BITNET). There's also a HAM forum (HAMNET)
on CompuServe, plus numerous other Bulletin boards, plus a system
of Bulletin boards run by hams that actually use ham radio to send
the messages around rather than phones.

Unless, of course the original poster (kbourque@mtholyoke.edu) meant
computer networks that use Ham radio as part of the transport mechanism
(e.g., TCP-IP) instead of "networks of people talking about ham radio."

NOTES:

1) This is only a PATCH to WA8DED firmware for using it with MFJ 1278 TNCs. The resultant code is still copyrighted by Ronald E. Raikes.
2) Code from 61B4 to 61F0 is added to the bottom of the original firmware so the original data is unknown.
3) BE SURE TO PATCH THE SAME VERSION
   these patches only work with the listed version
   (Check for original values to match with the listed ones.)
4) You can program this code on a 27C256 EPROM but in such case you must leave PIN 1 of the IC OUT OF THE SOCKET and wire it to +5 Volts (PIN 28 of the EPROM).

   If You use a 27C512 program the code IN THE SECOND HALF
   OF THE EPROM (starting from address 8000H).
 5) Remove the original EPROM at position U23 and install
   the WA8DED patched one, the MFJ 1278 will respond
   you as a TNC2 at 9600 BAUD.
   To work at 4800 BAUD Patch 61B6:48 61C6:08
 6) With this FIRMWARE you will lose the multi mode capabilty
   of MFJ 1278, it is intended to allow you to enjoy programs
   like SP in true HOST MODE.
 7) The patches listed are 110 if you read less this message is
   corrupted get a good one.)
 8) The followings new commands are available:

   @R0 (Default) Select RADIO 1 port
   @R1   Select RADIO 2 port

   @A0 (Default) Select VHF PACKET modem
   @A1   Select HF PACKET modem

   @X0 (Dfault)   Select 1200 BAUD VHF PACKET modem
   @X1   Select 2400 BAUD VHF PACKET modem (MFJ TURBO ONLY)

   @J For software experts only Cause a JUMP to location 7000H.
       I have put a EFKISS code here so i have kiss too.
       DONOT USE OR THE TNC WILL HANG
       (The code to be added at location 7000H to get EFKISS is
       available upon request.)

Actually TAPR has just released 1.1.8, which can be found on Compuserve HamNet Forum (GO HAMNET). I'm sure it'll be available on ham oriented BBS'es soon too. 1.1.8 fixes some bugs, and adds a new (and different) host mode interface. A companion file TNCHST.ZIP (also on CIS HamNet LIB 9) has info on the host mode, plus some sample software showing it's use. 73.

Actually, as of a week or two ago the latest version is 1.1.8. Supposedly, the new version adds a host mode. I'm still waiting for an electronic

release on CompuServe - one has been promised. I'm sure it'll be on
tomcat shortly thereafter.

I suspect that there aren't more articles in rec.radio.amateur.packet
because most packet guys can get their info off of their local packet
networks. I soon hope to count myself among thee.

(like the Catch-22 for would-be hams in our area... "How do I find out when
the next club meeting is?" "Just ask somebody on the 2 meter net next week!"
"But I don't have my license yet!" ... "Oh. Gee I don't know." :-))

((ever heard of the telephone!? :-)))

No! But seriously. I have a Ramsey Packet modem kit, and I want to connect
it to my Standard HT (Heathkit HW-2-M). The *classic* packet problem.
I'm a bit nervous about wiring to my HT without being *sure*, but I will
probably try the "generic" (Old ICOM/Yaesu) approach soon anyway:

I understand that Kenwood HTs are different. Has anybody actually hooked up
a Standard HT to a TNC? Please email me!

Thanks!

I'm not too sure what your talking about but I do use the ham radio to send
data, it's very much the same as a BBS. They call the "normal" BBS's "land
line" BBS's!!

Hope this helps some,

Hello All,

I have recently set up a PacketCluster Node, which is the first in
EI. Things have been running fine, despite a couple of early
problems.
Is there any other PacketCluster SysOp's out there?
I would like to bounce some ideas/problems off them !!!

Mail be at the address below

Thanks

I don't know about the original poster, but that is what I want to
find more about. A location/file that can give the very novice person
information on TCP-IP.   ^^^^^^^^^^^^^^^^^^

Thanks for any help

I'm trying to locate some OS/2 packet software. Can anyone give me some ideas of where to look? Os/2 Shareware and Fernwood didn't appear to have anything. Perhaps a simple mailbox or such thing.. FTP sites or BBS's appreciated!

I have put together the Ramsey Packet modem kit, and I am trying to get
it to work with my Standard 2m HT. I have studied the Standard HT
schematic, and I think that it is pretty similar to the Yaesu, older (?)
ICOM style HT Mic/Spkr input jacks requring something like:

for connections. I seem to be able to receive just fine, but for
transmitting, I see the S-meter on the radio jump, but I can't hear any
modulation in a monitoring radio until I fiddle with the "deviation"
resistor in the Packet modem. Then I get a continuous ~5000 Hz audio
carrier on the monitor radio *except* when packets are going out.
(during which time, I hear a packet modulated signal which sounds good)
The problem is that the modem never drops this carrier, so the HT never
returns to receive mode.

What might be causing this continuous carrier? And why don't I hear
anything on the monitor radio when the deviation is down? The transmitting
radio seems to be transmitting something then (at least briefly).

Thanks in advance for any help!

Why does this sound like an advertising con-job to me?
It looks like a commercial, smells like a commercial,
feels like a commercial?

Its informative information though I do admit.
I guess I have to say keep up the good work...

Steve

This morning I was chatting with some of the Antelope Valley locals
on 2m, when one of the guys asked another "Hey, should I get a vertical
to run packet?" and the other answered "You should run a beam so you
get through".

Gasp.

[In all fairness, the popular local frequencies already suffer

horribly from hidden transmitter syndrome, so using a beam probably
doesn't make anything worse, but it doesn't help.]

Then, when one station was complaining about poor receiver response,
I asked him, "Does your TNC have true DCD?" He says "Yes, but I use
my squelch anyway to quiet the receiver". Then, another station says
"It is wrong to run open squelch cause then you'll be too sensitive
and people with poor paths will digipeat through you and generate
multiple retries". I said "Oh, the TAPR paper from the ARRL CNC
proceedings pretty clearly shows the benefit of running open squelch
with a true DCD". What was I thinking? One station responds "Oh, the
squelch recovery time is shorter than the receiver recovery time so
it doesn't matter, cause the squelch recovers before the receiver does".
Huh? Another station then sagely chimes in, "Well, you can read all those
papers and tear your shack all apart making mods but it all doesn't
matter".

Gasp.

When I suggested that users should consider slight reductions in real
time response in order to have a more efficient overall network that
would support more users and have smaller drops in performance when
the channel is congested, the response was something like "My packet
station is OK, it is everybody else that slows it down".

Gasp

So, I'm tempted to prepare a presentation for the local club meeting
where I attempt to explain some of the mystical terminology of packet
(like, "What is FRACK?") and get the packet users to look things like
the CNC proceedings rather than just flying by the seat of their pants.

But, I think that might just be an exercise in futility. Maybe I'll
just work on a few locals, set up an IP net on the locally sanctioned
packet frequency (which sees zero activity), and ignore the unwashed.

What do y'all think?

If you send packet through a voice repeater (or any other repeater that
does not decode the packet and then reconstruct it before transmission),
then I believe it would qualify as a "repeater" by FCC's definition.

Please DO NOT send any more cards to Craig Shergold. Here is a detailed
article from news.misc on that subject for those that missed it on the
news:

From: kilroy@acme.gen.nz (earthbound misfit, I)
Subject: Re: Smilemakers
Keywords: Smilemakers request
Date: 19 Apr 92 04:15:38 GMT

Craig Shergold is now approximately 13, his cancer has been cured, and
he doesn't want any more cards of any kind. This story has taken on
a life of its own and can't be killed, which has driven the Guiness Book
of Records to withdraw the category from future editions.
The following is a semi-recent posting from alt.folklore.urban which
seems to cover all the bases fairly well, there was also a posting
news.announce.newusers along the same lines in the last 6 months.

FYI re Craig Shergold.
Millions of dollars (note the card totals below) have been spent on
this project, money which might have gone to research or treatment.
The EASIEST refutation is to cite
       READERS DIGEST OCT 1991 PAGE 71 US EDITION
        READERS DIGEST DEC 1991 PAGE 35 AUS EDITION
Sorry I don't know about other editions.
If THAT does not help convince people, read on....
---
9 Million Americans Respond to Plight of a Sick Boy
New York Times (NATIONAL), Sunday, July 29, 1990, page 24.
Craig Shergold, a 10-year-old English boy ill with a brain
tumor, remarked last fall that he would like to break the world
record for receiving get-well cards. Nine million Americans
have responded, answering messages sent through a loose network
of facsimile machines, office memorandums, neighborhood
conversations and community newspaper advertisements.
The boy's mother says she cannot handle any more cards, so a
third of them are languishing at an Atlanta charity, which had
initiated its own fax campaign for the boy. And the charity,
the Children's Wish Foundation, is trying to figure out what to
do with the cards.
Last November, a handful of English companies trumpeted Craig's
wish to break the record of Mario Morby, a 12 year-old English
boy suffering from leukemia who collected 1,000,265 get-well
cards earlier in 1989.
Story Changes as It Spreads
Craig's message soon reached this country and spread rapidly.
His wish was distributed on leaflets at a Boston street fair,
plastered on a billboard in Gadsden, Ala, advertised in a
newspaper in New Jersey, announced to the residents of Surry,
N.H. at a town meeting and disseminated by the Printing
Industries of America to its member businesses.
As the message spread across the country, the facts of Craig's
story became twisted. In Boston, a leaflet said he was 7 years
old, lived in Keene, N.H. and spelled his last name "Shirgold."
A Chicago physician said erroneously that he had treated Craig
for six years. Other accounts had the boy's disease as leukemia
and said he was from Florida.
In addition to the American get well cards, which came from
every state, seven million cards reached Craig from other
countries, said his mother, Marion Shergold, in a recent
telephone interview.
New Record in Guinness Book
Mrs. Shergold informed the Guinness Book of World Records of the
count as it stood on May 25: 16,252,692. Craig's
accomplishment, which includes the 3 million cards in Atlanta,
will be in the 1991 edition of the book, to be published this

October, said Cathy Brooks, a Guinness Book spokeswoman.
Mrs. Shergold said she "can't say a big enough thank you" to her son's correspondents, but she added, "We don't want any more cards."
Officials in the office of the Georgia Secretary of State, asked by Children's Wish Foundation for advice on what to do with the cards it had collected, recommended that the charity follow the wishes of Mrs. Shergold. She has said the foundation should open the cards, share them with American children who have cancer and eventually recycle the paper. THe proceeds from the recycling, as well as any gifts received on Craig's behalf, should also be used to help sick American children, Mrs. Shergold said.

Photograph of a bald but smiling Craig holding a plaque goes here. The caption of the photograph reads "Craig Shergold was given a certificate by the Guinness Book of World Records after he received more than 16 million get-well cards. The 10-year-old from Surrey, England, is ill with a brain tumor.

In response to inquiries from news organizations about Children's Wish and it's handling of the cards, the Governor's Office of Consumer Affairs is "actively looking into" the matter, said Bill Cloud, a spokesman. The office is particularly interested in whether the foundation solicited any financial contributions during its campaign for Craig, Mr. Cloud said.
Linda Dozoretz, executive director of the foundation, who has met with Craig in England, said the foundation never asked for money on his behalf and has not opened any cards addressed to him, but it had received direct contributions totalling about $120 on his behalf. The money has been deposited in an Atlanta bank account that the foundation opened in Craig's name, Ms. Dozoretz said.
The foundation, which, like the better-known Make-A-Wish Foundation of America, fulfills the wishes of terminally ill children, came to the attention of the Georgia authorities last year, when the Secretary of State, Max Cleland, fined Ms. Dozoretz and Arthur Stein, the foundation president, $2,500 each. Mr. Cleland said a foundation radio promotion for ill children had used bogus names for the children without informing the public of that. He also said the foundation had used money left over from the granting of one wish to pay for others, as well as salaries and operating expenses, in violation of Georgia law.
Mr. Stein and Ms Dozoretz, who are married, waived their right to a hearing on the charges and paid the penalty without declaring guilt or innocence said Randy Willard, an investigator in Mr.

Cleland's office.
Mr. Stein said in an interview that he knew he had broken Georgia law by changing the children's names, but said he would do it again to preserve privacy. He said the foundation did not take money earmarked for one wish and apply it to others, but rather deposited all donations in a general fund from which it pays for numerous wishes.
He said he and his wife, "on the advice of an attorney," did not request a hearing with an administrative judge on the charges, but paid the penalty to "get the thing over with."
Began by Chance Remark
These activities are of little concern to Craig, who lives in the town of Surrey, in southeast England, with his mother and father, a truck driver. Craig's campaign began last September, when a surgeon who was treating him for tumors of the brain and spine at the Great Ormond Street Hospital in London joked that Craig had received so many cards from friends and relatives that he could set a record.
That set Craig and his parents to thinking, and with hospital officials' assistance, they asked local companies to spread the message of his wish.
"And from that grew an enormous chain letter that went round from company to company and then country to country,: said Pam Rumfitt, an appeal director at the Royal Marsden Hospital in London, where Craig, now 11, is now treated as an outpatient.
Mrs. Shergold said she was grateful to her neighbors for meeting each Thursday to sift through the mountain of cards. The stamps are sold to a collector in London, with the proceeds donated to help children with leukemia, while money from recycled envelopes is given to schools for the handicapped, Mrs. Shergold said.
Though Craig continues to battle the brain tumor and sometimes uses a wheel chair, his mother says he has responded well to treatment and the tumor on his spine has disappeared.
Ms. Rumfitt said: "The whole family has been sort of bowled over by the show of good will. THe cards have been the best medicine in the world for him."

From Houston Post Nov. 22, 1989, page A-13 ******* NOTE THE DATE ********
"Ailing boy has greeting card record"
AP (London) A 10-year-old boy suffering from a rare brain tumor has captured the official world record for receiving the most get-well cards, officials said Tuesday.

Craig Shergold's mountain of 1,256,266 get-well cards tops the previous record of 1,000,2656 cards held by another English boy, 12-year-old Mario Morby.

A spokesman at Guinness Publishing Ltd. said Craig received an official certificate and his record will be included in the next edition of the book, "The Guiness Book of World Records 1991."

Shergold said from his home in Carshalton, south London, that he was confident he would make it into the record books when his attempt began Sept. 24.

Marion Shergold said the attempt to break the world record began as a way to cheer up her son after he was too sick to meet Princess Diana.

From the Houston Post, June 20, 1990, page A-3:
Get Well Cards Keep Coming
(Associated Press)

London - Despite appeals for it to stop, 10-year-old Craig Shergold receives hundreds of get-well cards daily from strangers trying to help him win a place in the "Guiness Book of World Records."

Craig, who suffers from a rare form of brain cancer, broke the record months ago, but the cards keep coming. More than 16 million have arrived.

"We don't want any more cards because it looks as though we're taking cards for no reason," Craig's mother, Marion, said from the family home in Carshalton, south London.

"Every card says 'we hope you make it in the record books,'" she said.

The get-well cards category was discontinued by Guiness once - after Mario Morby held the record with 1,000,265 cards. McFarlan [presumably a spokesman for Guiness] said the 13-year-old English boy is recovering from leukemia but the family still receives cards three years later.

McFarlan revived the category after intense pressure, and Craig now holds the record.

"I thought I had decided over a year ago that (Mario Morby) would be the last one, but it is very difficult to hold out against an emotive press. I couldn't do my job - well-intentioned, very sentimental people called me at work, and I received quite a lot of hate mail, including one that said, 'if you have children I hope they die of cancer.'"

Ask for Cards, and Ye Shall Receive and Receive and Receive
by Douglas Burns

WEST PALM BEACH, Fla. -- A 7-year-old English boy with cancer is finding that once a story hits the modern-day grapevine of fax machines and computer bulletin boards, it is impossible to stop.

Critically ill with a rare brain tumor, Craig Shergold told his parents and nurses at a British hospital in September of his wish to be in the Guinness Book of World Records for owning the world's largest collection of post cards. The same wish was fulfilled only a year earlier for another English boy with cancer.

Once the news was out, it flowed through every conceivable medium to even the most unimaginable places on the globe.

Budget Rent A Car in Miami got news about Craig from a Budget office in Gibraltar and sent one of their employees out to alert South Florida businesses.

``We also passed it around to all our offices in the nation,'' said Maria Borchers, director of travel marketing.

Children's Wish International, a non-profit organization based in Atlanta, is also working to get cards for Craig. One of its appeals made its way to a computer bulletin board run by Bechtel, a Maryland-based company with an office in Palm Beach Gardens.

``We are getting 10,000 to 15,000 cards for Craig per day,'' said Arthur Stein, director of Children's Wish International.

But Craig doesn't want any more cards.

In November, he received a certificate from Guinness after his mountain-sized collection of 1.5 million cards broke the record set in 1988 by Mario Morby, a 13-year-old cancer victim.

Since then, Craig's dream has become a logistical nightmare for his parents, phone operators and the Royal Marsden Hospital in Surrey, England.

Monday, the unofficial count for Craig's collection reached 4 million, said Mark Young, a Guinness Publishing Ltd. spokesmen. The hospital has set up a separate answering service to implore callers to refrain from sending more postcards.

Despite pleas of mercy and reports in the media, hundreds of post cards continue to pour into the hospital every day.

``Thank you for being so kind,'' said Maria Dest, a nurse at Royal Marsden. ``But he really does not need any more post cards.''

Dest said that whenever a corporation gets wind of Craig's plight, the bundles of mail increase.

``As soon as it starts to slow down, it goes around again,'' she said. Dest would not discuss the specifics of his condition. ``His condition is deteriorating, but he is still able to talk and function,'' she said.

Young, with Guinness, said he gets several calls every day from people who question if Craig Shergold even exists.

``This is definitely legitimate and Craig will be in the 1990 Guinness Book,'' said Young.

But because of the problems the two appeals have caused, Young said Guinness plans to discontinue the category.

The public outpouring for Mario and now Craig surprised virtually everyone involved, he said.

``These two boys really captured the public imagination,'' Young said.

[Ann Landers column, undated but from mid 1991]

ONE GUINNESS RECORD ENOUGH FOR BOY

=== ======== ====== ====== === ===

Dear Readers:

Last year I began receiving tons of letters telling me about a 10-year-old English boy who had a malignant brain tumor. His wish was to be in the Guinness Book of World Records for receiving the greatest number of get-well cards. The boy's name is Craig Shergold.

Several months ago I read a piece in the press saying Craig's dream had become a reality. He surpassed another English lad, a leukemia victim, who had received 1,000,265 cards, which put him in the Guinness Book of World Records.

Marion Shergold, Craig's mother, announced that he had received more than 33 million get-well cards from all over the world, including cards from former President Reagan, President Bush, Margaret Thatcher and Mikhail Gorbachev. She said her family is very grateful for the overwhelming generosity but now she hopes people will stop sending cards. "Unfortunately," Mrs. Shergold said, "we are still receiving thousands every day and have no place to store them." Meanwhile, I continue to be swamped with requests from readers asking me to print a plea in my column for *more* cards.

I decided to follow up on Craig's story, so I contacted the Make-A-

Wish Foundation, which had worked with the Shergolds. The people there told me that John Kluge, a Virginia billionaire, arranged for a brain surgeon in Charlottesville, Va., to operate on Craig. Kluge brought the entire Shergold family to the United States so they could be present for the surgery.

Then I called Marion Shergold in London. She told me the surgery was a great success and the Craig is doing beautifully and is expected to live a full life. She also said, "This is like a fairy tale. Things like this don't happen in real life. Mr. Kluge is a saint." In her marvelous British accent, Mrs. Shergold said excitedly, "Tonight we are having a God Bless America party. About 150 people are coming to celebrate Craig's great good fortune."

Now, dear readers, this lovely story now turns a little sour. I just received a request from a well-known Chicago man, asking me to publicize the fact that the same lad who broke the world's record for get-well cards would now like to break another world's record - this time for collecting the most business cards. This man is one of dozens of affluent, high-profile Americans who are faxing and chain-lettering [it's a noun! it's a verb! it's a desert topping! --jjw] their friends on behalf of Craig's "new project." In the chain letter, Craig's name is misspelled, his age is given as 7, when actually he is 11, and the address is incorrect. These errors set off the alarm signals in my head. [so THAT's what it takes! --jjw]

Chain letters themselves are an abomination. I never read them, nor would I foist them on anyone, much less ask my readers to keep the chain going.

What's more, Marion Shergold wants everyone to know that the Shergolds did not ask for business cards and they do not know what to do with the 10,000 that are arriving daily. While they greatly appreciate the kindness of the American people, they asked that I please help put a stop to this well-meaning effort that is turning into a nightmare. Soooooo, to all the good-hearted people who may be inclined to send a business card, please don't.

I would also like to point out that your business card, which most likely lists your phone number and address, could fall into the wrong hands and become part of the mother of all mailing lists. Sharp-eyed scam perpetrators, always on the alert for suckers, may figure if you'd fall for this, you'd fall for anything.

In the Romford Yellow Advertiser, I saw the following article the other day:

Craig, 8, has cards record

The parents of cancer sufferer Craig Shergold, 8, have requested that no more get well cards be sent to their home.

Last year Craig, who lives in Surrey and was diagnosed as having just a short time left to live, launched an attempt to gain an entry in the Guinness Book of Records as the person receiving the most cards.

Recently letters have been circulating amongst businesses in South East Essex encouraging firms to send more cards.

But a spokeswoman at the Guinness Book of Records told the `Yellow Advertiser': "Craig has made the record and will be entered in the next edition of the book. His parents have requested that no more cards be sent as they have been inundated."

Now for the "proof" part:

IS he actually *IN* The 1991 Guinness Book of World Records???

Yes, he is. On page 487:
  "Craig Shergold of Carshalton, Surrey, United Kingdom, had collected a
  record 16,250,692 get-well cards by May, 1990."

One thing that does not come over from this is the HUGE PROBLEM thisd
has been for the london hospital at the receiving end. Do the
arithemetic.
Craig has been sent about 33,000,000 cards. This has been going on for
4 years (or so), so that is 1,000 working days. Thus each day the
hospital has to sift through 33,000 cards looking for money in them (not
unusual), or more realistically the hospital's normal post!
(OK, I know that a lot of the cards are stored in the US somewhere, but
I wanted to make a point).
Also, think about the stupendous waste of money this has been.
33,000,000 cards at (about) 50 UK pence, plus 33,000,000 postages at
about an average of 20 UK pence is 70 times 33,000,000 giving about
23,100,000 UK pounds. The money would have been better spent on a whole
raft of things - dare I say it, even Cancer Research!

Being a "computer" type, I got involved in Packet Radio. Note quite back in the dark ages, but close. I got a TNC-1 kit (in the pretty black box!) and put it together. Tried to figure out who thought that X.25 LAPB, a serial line point-to-point protocl was a good idea in a multipoint, multi-access contention based environment. Turns out that no one really thinks its a good idea; actually, most don't think about it at all. They just run more power, or put up "wide-area" digipeaters to ensure we would all be plagued with hidden-terminal problems. Sigh.

Hacked a while with AX.25 and tried to figure out why I would want to log into a BBS at a pathetic effective rate as compared (at the time) to my 2400 bps landline modem that I used to read USENET. Heck, even an honest 300 bps would have been better. So I punted. Sigh.

So, I run into Phil at a regional packet radio meeting, and we marvel how all the BBS users are trying to build a distributed BBS system using the W0RLI and "mail", slowly but surely re-inventing USENET news. We point out that this has been done, but of course, not by hams, so they can't use it. Feh. Try to explain TCP/IP and no one can understand why you'd want to use it since you can't log into the local BBS. Sigh.

Then comes Phil with his TCP/IP stack, which was really interesting. I started hacking on it when it was running on the old Xerox 820 boards; started a port to a 68000 single board micro. Not enough memory. Then came a new and improved version of NET for the PC, and I bought an Amiga and ported it. Hmm.. needs KISS, so I buy a MFJ TNC. KISS and my AmigaNET work pretty well. Hmm.. works even better over the aforementioned 2400 bps landline modem. Radio? Why use this radio stuff? Sigh.

Then comes even niftier NOS and my 2400 bps modem is replaced by a V.32 9600 bps modem. So I do an AmigaNOS hack/port. Pretty nifty. Co-ordinate and set up the first coast-to-coast "wormhole" (running as WA3YMH-1, remember that?). I thought it was an incredible hack and pretty ugly. But folks thought it was wonderful. I was rather more impressed by the 56KBPS PSK modems used on the commerical satallite transponder that we shoved digitized audio though. Sigh.

It was also the first place that NET/ROM really got used. I am so ashamed to have even inadvertantly contributed to the "success" of NET/ROM and its bogos distance-vector routing protocols with all the wrong time constants. Try to explain to folks that you can't just

vary the metrics used by NET/ROM without having ALL the nodes configured coherently; otherwise you get horrible routing loops. Sure enough, horrible routing loops. You try to explain Bellman-Ford distance vector protocols, and why they are really bad news for asymmetric paths; but they think its great. Of course, they don't realize that they might as well not even have the routing protocol sicne its all so highly hand tuned. Sigh.

Finally I decide that I need a real computer, so I sell the Amiga and get a UNIX box at home (NeXTstation, 700MB disk, 20MB memory). Article in QST comes out months later listing me as a source for the AmigaNOS port. Not that the author of the article bothered to check.. I didn't have an amiga for months and handn't worked on the code for more than a year. I stopped when all of the AX.25 "mailbox" crap started to get loaded into it. I still get floppies in the mail asking for the code. Please, I don't have it any more! Sigh.

So now, I've got a V.32bis modem and a SLIP connection to the Internet. I can't really think of a reason to use packet radio. Few around here want to do anything other than BBSing. I communicate with more people more effectively using EMAIL over the Internet.

Try to convince a group of random hams that would support a 2m FM repeater that they should invest in some packet switches. You know, so you can build a real network? "Why do that?" they say, "We've already got more full service BBS systems than we need!" Sigh. Feh.

The unwashed masses don't want to be educated, they want to be given appliances. Sigh.

I think that you should forge ahead, document your results, get some people
who are interested in experimentation to help, and then when the
majority decides that you were right (even if they don't know "you"
were even involved in early experiments & tests), you can say to yourself,
"I was right." And next time, you will feel even better about venturing
into the unproven!

It's hard to quickly change the mind of the majority (history says that's
good), but it's nice to know you were right, "way back when..."

I'd be interested to know how you do with your experiment.

Regards, and (literally) 73,

>Useless. And perfectly typical for ISO.

Another useful reference is the September 1986 issue of Byte Magazine.
On Page 115 there is a article titled "Calculating CRCs by bits and bytes".
It covers several CRC methods (including the HDLC one), explains the
"shift registers", and gives example code for bit and byte oriented
calculations.

I was sucessful in implementing a routine to check pacsat protocol crcs by
reading the article and the pacsat docs.

I aggree you should test it with a "real" HDLC chip to see that it works.

My PK-232MBX was slowly going deaf. The transmit was okay, but I was having
trouble receiving packets. I would connect to a station and get good ACKs, but
was having trouble printing them and since I was not receiving their packet,

they would time out waiting for me to ACK. This problem did not happen over night but seemed to degrade with time.

Called AEA and the technician suggested I change out U-20, MC-1488. I used a Radio Shack 276-2520 Quad Line Driver. It worked! I have to admit it was not easy to remove the old IC that was soldered to the board. It now has a socket!

If your PK-232 seems to be going deaf, consider replacing U-20. Much thanks to AEA for the tip. Save me having to send the PK-232 off for repair.

If your packet community is anything like the local packet community here in San Diego, you will educate a few, piss off a few, and bore the majority who are convinced they already know everything there is to know in packet because they have an advanced station - a PK64.

If you can suffer fools well (something I've never been able to do), the few you educate will be worth your time.

Take a few props with you. A squirt pistol, a 2x4 with nails sticking out of it, and an AK47 all suggest themselves as attention getting devices, but perhaps only the squirt pistol is necessary. My current favourite is a Super-Soaker 200, good for nearly 20 feet range, nearly a

full minute continuous stream, and 2 liters of ammo.

If you're worried about attendance, offer free Geritol. Never fails
to attract a crowd.

Well, here is the email response you have been looking for....
GRAPES is real small when it comes to modems, it is just a club
project that keeps getting bigger. If you have any questions
about the modem/availability, please drop me a line. I'm the
current President of GRAPES (Sucker/volunteer). I'm also highly
involved in the local LANS. Currently most of the core group of
GRAPES volunteers were at Dayton, and should be returning to their
requlars lives of little or no time to devote to the tasks at hand.

Important Email addresses -
     emory!nanovx!dennis   (Dennis Boylan N4ZMZ) (myself)
     emory!wa4mei!ke4zv!gary(Gary Coffman KE4ZV) (prolific on usenet...)
     emory!kd4nc!dug   (Doug Drye KD4NC) (shipping, et al)

Hopefully we can finish up some projects and emailing to us will be
something like -
     modems@grapes.org

But all of this takes time... Should get to it before the end of the
year...
  Dennis

wpns@pictel.com (Willie Smith) writes:
: I read in the March(?) QST that the ARRL requested that the FCC change
: their rules slightly on the "Business" use of ham radio. Most of it
: seemed to make pretty good sense, but buried at the end of their
: proposal was a section that "With the exception of stations in
: Auxiliary, Repeater, and Space operations, amateur stations are
: prohibited from automatically retransmitting other amateur's
: transmissions." or some such. Sounds to me like a big problem for
: packet operations.... Did anyone else catch this, or did I just read
: it wrong?
:
: Willie Smith
: wpns@pictel.com

The reason as I understand it is that the ARRL has chosen to
seperate the two issues, i.e. responsibility for transmission and
business content. ARRL feels they have a good chance of getting the
97.113 modification through, but will run into problems with
the commission on "who's responsible" for a transmission.

The league has approached FCC about the responsiblity issue
at least once in their comments to FCC on the 1989 re-write
if memory serves. These comments fell on deaf ears. Consider
this not a dead issue, but not tactically advisable to pursue
in this proceeding. Linking the two issues would cause no
change all at this time. I'd rather see 97.113 lightened up
then pursue the other issue vigorously.

A good tutorial article on CRC's is "A Tutorial on CRC Computations" in
IEEE Micro, August 1988, p. 62-75. The information is presented at a more
advanced level than Byte Magazine so it may be useful to those implementing
the algorithm; it also includes many references for those interested in the
gory details. (IEEE is the Institute of Electrical and Electronics
Engineers.)

The police here have changed over to MDT's. Being a very serious
scanner listener, I would like to monitor these signals. The reason I
post here is because they are using a digital form of communication and
what better place to ask about DIGITAL than fellow digitizers.

Anyone else out there trying to do what I am? Is it possible to break
their codification? Anyone having success?

This is a Macintosh, PK-232 and NET/Mac tcpip posting.

I need help with a Console command. What command can you issue from the Console (or autoexec.net file) to change the PK-232 for HF operation? The two commands I would like to issue are:

```
VHF        OFF
HBAUD   300
```

The 'only' way I have been able to change from VHF to HF is to manually make the changes in normal ax25 mode, quite the non-ip program and then load NET/Mac. This is a pain! Hopefully, someone has figured out how to command the PK-232 from NET/Mac's Console window.

Please reply via E-Mail or Packet

Please see instructions on using my gateway below, please DO NOT send test
messages ... they will be cancelled at the gateway.

If anyone has any questions, drop me a line.

David

How to Use the wb7tpy.ampr.org
Internet <-> Amateur Packet Radio Gateway

From Internet/Usenet/Bitnet/Fidonet to Packet:

Send email to "gate@wb7tpy.ampr.org" on Internet or "gate at 1:114/15"
on fidonet.

The first line of text must be:

Packet: user@callsign.hierchial.address

ie

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet/Usenet/Bitnet/Fidonet:

send email on packet to "gate@wb7tpy.az.usa.na"

The first line of text must be:

Internet: user@site.domain

Any questions can be sent to:

wb7tpy@wb7tpy.ampr.org (Internet)
wb7tpy@wb7tpy.az.usa.na (Packet)

I've been waiting for all the real experts to get home from Dayton
and answer this question, but since there's still no sign of them... :-)

If all you need to do is read bulletins from someone else's PBBS,
NOS is just fine; just use its AX.25 capabilities. But it sounds
like you want to be able to collect messages on your own node; in
that case, I'll let someone else answer the question of whether there's
any version of NOS that can do that.

Patty

Oy vey, is it not compatible.

All you anti-Intel bigots who moan about the architecture should take a look
at the architecture of the HP48SX's CPU, called the Saturn. After that, the
80x86 looks positively regular.

Howdy:

I have finally gotten a belly full of people doing what the gentleman did to me yesterday and to which I responded. I am sending a long statement. It is not a flame, however. You may have no interest in it whatsoever, and I encourage you to hit the n key now if you are uninterested in my personal affairs, in AMSAT, AEA, DSP, LL Grace, etc. He has written me a very nice note, and I appreciate it. He is quite correct that I should state exactly where I fit in all this. I will now.

AEA has, through a corporation set up in New Jersey to handle the DSP-2232, the Paccomm PSK-1, DOVE hardware for AMSAT, etc. paid to me a grand total of a whopping $16,000 for expenses on 3 years work on this box. I can assure you that has not even remotely covered the costs to myself. Not even close. Not anywhere near close. I do not even own the DSP2232 I am writing code on. I wrote Quiktrak. I gave it to AMSAT for four versions. Before Antonio wrote Instantrak, it was the single largest source of revenue for AMSAT, raising hundreds of thousands of dollars for AMSAT and they have never paid me a dime for it. AEA owns the hardware and software in the DSP2232 and will not pay me a nickel in royalties on ANY of it. In return for these, I get to do things for AMSAT and in amateur radio that people only dream about doing. I get to go stand on the gantry of launch vehicles, and work on space hardware that many would give half a lifetime to work on. For not receiving royalties on the AEA hardware, I get to keep all my software SOURCE and AEA cannot sell it or show it and that ladies and gentlemen is worth a bundle. I get AEA to loan me equipment for my personal use that I could never remotely hope to afford. I get the benefit of learning an immense amount of stuff that has been very helpful to my day job and had experiences that I have applied to it and for which I have received many accolades at work. I have received compensation that to me is irreplacable. I am not a saint however. I will write modems for commercial use and for that AEA will pay a bundle. I also get the right to brag as far and as wide as I want to about my achievements. If AEA had paid what I was worth in doing this, none of you could remotely ever dream of affording this box. I will not brag about the quality of the modems done for the final hardware (that hardware upgrade kit many of you got is what I am talking about) versus others. I'll let word of mouth from people who own the various boxes tell the tale as those of you get the new ROM from AEA over the next month. I make the following pledge. If you find a modem ANYWHERE that outperforms the ones in this box, I will not stop working on them until they are the best or find out why they cannot be the best because of the comprimises we made in making this box do `everything' and tell you about it. The gentlemen yesterday told what Brooks (LL Grace) did for his customers. I apologize for this taking so long, but this is being done through a company with real people working for it, and many things on their

platter, and it is taking them longer to respond than I would have liked and that is partially my fault. Because it is being done via a commercial company, you will not get the experimenter's package with schematics, floppies, programming models, assembler's, debuggers, for free. They will have costs associated with making these available in a professional form, and in a form they will be proud to have their name on and one that they can easily support for years to come. That is what you get (and pay for) when you buy from a bigger company versus a garage operation. They pay full time staff to support you as best they can. We all know that is not perfect but it is better for most people than getting an answering machine while the guy is at his day job and hoping he will call back that night. I cannot believe what Brooks has been able to put together in the DSP-12 working in his garage with help from others he got all on his own. I congratulate him on it and wish him well. It is a great personal achievement for him and his team. His work on this and on the Kansas City Tracker have made sure that he will go down as one of the best technical innovators in amateur radio. I will stand by my feelings that his temporary time at the top on these DSP multimodes is over. For those of you who insist on programming the host processor, the DSP processor, and want to spend time on that (all couple of dozen of you) it is the right way to go for you if you program C or assembler on a PC. It has a V40 in it, and he has made it easily accessible to you. That is great. He is definitely serving a niche that AEA is not, and maybe will not support. I will probably buy one myself and play with it since I am pretty good C and assembler programmer myself (see reference to Quiktrak above). I have written code for the V40, it now flies in space as the command and control system on four Microsats, and so I am pretty familiar with it. It is not the best IO processor however. It has some real drawbacks for doing this kind of work. I am sure that Brooks will be glad to impress you with how he has had to struggle to get it to do all the jobs it needed to do and (say) keep up with 9600 bps sustained from UO-22. On the other hand, from the first day I got the DSP2232 host code from N6IA, it would breeze through 19200 bps. The 64180 is simply faster at handling byte oriented IO than the V40. PERIOD. DMA (which only the DSP2232 has) on the 8530 in the final version has sped it up even more, End discussion. To add insult to injury on the timing side, the 64180 is clocked faster in the DSP-2232 than the V40 is in Brooks box and it is eight bit instructions rather than having an eight bit data space and doing two fetches to get the 16 bit instructions! It all adds up and the bottom line is that for doing the IO job these boxes want done, the 64180 implementation is hands down faster than the V40 implementation in the DSP-12. It depends on what you want! Steve is hacking around now to support sustained 38400 so that we can easily support full quality, 256 shades of grey as many pixels per inch as are in the original signal, SSTV, WEFAX, etc. The drawbacks are that this processor is NOT widely used to say the least in PC's and many have given up programming the Z80, even if it does have fancy bank switching for a big address space. In my opinion it is STILL the right choice for that box, especially given the number of man years that went before it on the TNC's and the PK-232. Steve Stuart is simply the best I have ever seen at writing that stuff and AEA has chosen to make the most of that asset. On the other end of the system however, there is no comprimise with you the adventurer. You will be given a complete access to the DSP processor. You will be told all that you need to know, and given examples of how to do it, and a technical manual to help hold your hand, and it is my hope AEA will make the schematics available. The access is already built into the existing system and will only get better.

On the host side for those of you who still remember how to program a Z80, and who want to learn the weird and wonderful ways of handling the segmented address space and write your own applications, we are putting together a debugger for your pleasure (I really am a sadist at heart ;-).

This weird relationship has cost AEA something as well. They geared up the advertisements before it was ready and many pressures stopped me from finishing. It is now finished and the testing, perfecting, and bug removal will continue. Because of the strange nature of doing this kind of stuff in the amateur radio market, where the real costs associated with doing something like this are never seen or passed on to the customer (since they are not charged, this applies both to Brooks and partially to AEA in this case), you the purchaser will find stuff you don't like because there is no way you could pay for the box if it went through the million dollar testing program to find out the stuff you complain about. The bond of trust you get when you buy from LL Grace or AEA in this kind of strange market (I know no other like it), is that they make upgrades to you for `free.' That is, the costs of doing the upgrade to you are what you pay and not for the time spent on doing the fixes. In the normal commercial world, the testing costs as much or more than the bloody development. I apologize to AEA publicly for the six month delay in which they sold without benefit of the real modems designed for the box as it was being shipped (new analog front end, no dual ports, etc.). That is done with and behind us.

As to the gentleman's statement that Brooks and I are hated enemies, that is hogwash. Brooks and I have had legitimate differences. We designed the DSP2232 together with KA2MOV. Before it was close to market, he went on his own and did the DSP-12. They have both arrived at market at about the same time. Both serve different clients and the overlap in their markets is actually quite small. AEA will service primarily the HF market, and will serve all the gee whiz folks who want the FAX's, etc. Brooks will serve the experimenter who wants to get at all pieces of the box easily and is only comfortable dealing with PC like stuff. Both serve the satellite markets amply well, Brooks and I both `grew up' there in ham radio. Because Brooks did the DSP-12 while I was still humping on a product we did together with AEA, I was extremely angry. It eroded the trust between AEA and me. Now with hindsight being 20/20, on the part of Brooks, myself, and AEA, finding out we have different goals, mostly different markets, that is all behind us and we are marching to a positive tune rather than stabbing each other in the back. At the time, because I was so heavily weighted down during the late part of the year 1990 and the first few months of 1991 and then the last few months of 1991 with what I like to call world events, I felt extremely guily that he had beat AEA to market. They were angry and in turn, I was angry beyond repair. I believe legitimately so, you may not. I want that to be behind me now, and I am looking only toward the future.

That is the end of my free flowing diatribe. The bottom line is that I have misled people concerning this box by saying that getting less than N dollars per box is no incentive to go faster (when N is actually a negative number, having cost me money), because I did not want to hear people telling me what a fool I was but I am tired of the damn holier than thoughs and I will tolerate it no longer. I strongly believe the DSP2232 is the best existing DSP system. Time and you will tell. I will continue

to brag freely here and elsewhere so that you know what is in it and can share my excitement in these achievements which I sincerely hope you enjoy using.

Have fun with the DSP2232 or the DSP12. Decide which is right for you and go get it. DSP is the only affordable way for amateurs to do the myriad of specialty modes we have available to us. The price tag seems high. I want you to think about what it is you are getting for that. You are getting a box that does as much as boxes and modems totalling tens of thousands of dollars, AND, if a new one comes along, we change a ROM and you've got it as well. A new satellite modem? (such as RSM on AO-21) no problem, here is a new file, upload it to your box and go on. Yes, I am as excited now as I was when we started all this mess with W3IWI. It can only get better.

Bob

Subject: 9600 baud for GE Master II
To: packet-radio@ucsd.edu

Looking for advice on interfacing 9600 baud (K9NG/G3RUH) modems to a VHF GE Master II running as a full-duplex repeater. The manual implies that the exciter actually uses phase modulation instead of frequency modulation. Will I have to make a varactor modulator and attach it in parallel with the crystal in the oscillator module? Does anyone have a working circuit that I could copy? Are the receiver/transmitter bandwidths wide enough to handle 9600 BAUD?

And finally a more generic question: can anybody suggest sources for 2-meter duplexers at a reasonable price? There is a possibility the duplexors may be exposed to a relatively high-humidity environment.

Just use the Channel Guard input for your modulation. Works great, costs

little. The receiver passband is a little on the tight side, but it'll work.

Join your repeater coordination group. If they publish a newsletter or magazine like SERA does, there will be a source for contacts who have duplexers for sale, or know where to find them.

Subject: FM radios for 9600 packet
To: packet-radio@ucsd.edu

I have been quietly searching for a good affordable radio for 9600 baud packet. There is currently the Tek radio. It costs about $150 and leaves much to be desired. Kantronics has a radio, that does OK but the RX performs poorly in the madding RF environment of Greater Disneyland.

The Riverside Fire dept runs 9600 baud packet. They also finance some amateur nodes under the bogus "public service" banner - Your tax dollars at work.

So I ended up talking to Mike Burton, N6KZB of Riverside Fire Brigade about what radios to use. He said he had been using some Kenwood models - the TK-710 and TK-810. But of course, these have since been discontinued and replaced with "improved" models with scanning and more LEDs. Yes, of course the price has gone up.

He said his radio of choice is now the Yeasu Vertex line. They have models with 4 channels and 24 channels. These radios are true FM, 40 Watts and are available for low band and high band VHF as well as UHF (6M, 2M, & 450 in hamspeak).

So I called his supplier who told me the following: He would sell me the radios for $449 for the 4 channel model and $509 for the 24 channel model. He would supply the radio programmed to my choice of freqs. Well silly me, I asked if I could reprogram them, was it just a PROM change etc. He then claimed that the programming info was Yaesu prorietary and he couldn't give it to me, but would be happy to do it for it for $50.

This is crap. This is like a car dealer saying they won't let me have service info, that only the dealership can change the spark plugs.

So, does anyone have the programming info?

Does anyone have or know where I can get service docs?

Anyone know anywhere else I can buy these radios?

To: packet-radio@ucsd.edu

I'd like to send a mail message from an internet node to a
packet radio user at NTS node K1MEA-8, located in western Mass.

Which gateways have been established for this type of messaging,
and how do I include them on the mail address line?

(Note: I'm not very familiar with NTS)

Thanks,

All good advice.

> Finally, you can invest in some conductive
> sprays for the inside of the Mac case, complete disassembly required.

Don't bother. All Macs already have such coatings on the inside of their cases. You might consider looking at that Hard disk drive. The radiation is not likely to come from the Mac, but from an external device, such as the disk drive mentioned. Try switching off suspect devices to narrow the problem down.

> And you can put ferrite chokes on all the external cabling which

> and ground it at both ends.

I have yet to see an unshielded SCSI cable for the Mac. If you are using one, toss it an get a good quality cable.

I've been using a VT220 on VHF packet without problems. Not much RFI. But
my radio's antenna is on the roof about 20 feet overhead. Also use this
terminal to read NetNews at home (using it as I type this).

To: packet-radio@ucsd.edu

Tom, I am not sure whether or not the existing Internet<>Packet gateways are
currently configured to handle NTS Traffic (Maybe Jim/W2XO can enlighten us).
In any event to send a piece of NTS traffic via packet, you need to locate
a consenting amateur (like myself) who will take your message, put it into NTS
format, and place in on a full-service AX.25 BBS for forwarding. If you would
like me to send a piece of traffic to your friend, please send me the
following information:
1. Your friend's name and call (I assume his HomeBBS is K1MEA.MA.USA.NOAM).
2. His address, including his zip code, as the packet network uses postal'
zipcodes for forwarding.
3. A local phone number
4. A message of about 25 words (no more than 30). Be sure to end sentences with
"X" (X-ray) instead of a period. Each "X" counts as a word.

Depending on whether or not your friend operates packet you may be able to
send a direct message to him through one of the gateways. One of the fine
and generous people who operate the Internet<>Packet's gateways should
be able to provide you with the necessary information to do that. Otherwise,
I would be more than happy to handle a piece of NTS traffic to your friend.

Subject: Packet on a NeXT
To: packet-radio@ucsd.edu

Anyone written a packet driver for a NeXT box? If not I'm going to,
and could use a little direction. Since I want to use an RS232 port
for the physical connection to the modem, should I modify a SLIP
intermface (to work with AX.25)?

Just passed the exams, and am making plans (budget). Ideally, I would
like to NOT have to explicitly indicate a radio device. Rather, I'd
like to run commands normally, and use a radio domain name like:

ftp machine1.amrd.org

BTW I like what read earlier about an ametuer radio domain name;
that's
a CLEAN way to keep everyone happy.

Subject: PI card software update
To: packet-radio@ucsd.edu

I am releasing an update for the PI card software, for both the compiled-in
and packet driver versions. There was a bug in the DMA driver code which would
cause received packets to be lost under some situations. The performance
with sliding window protocols is greatly improved, and you may find that
you no longer have to run in "stop and wait" mode (ie, with tcp window = mss).

The replacement files for the compiled-in version are in PI920323.ZIP,
and the packet driver version is in PI_DVR3.ZIP. These may be found
on hydra.carleton.ca in pub/packetstuff. I have also put them on UCSD.EDU
in hamradio/packet/tcpip/incoming.

Subject: Setting up 'conventional' TCP/IP for packet
To: packet-radio@ucsd.edu

I am interested in using TCP/IP for working packet radio instead of the default AX.25 that my TNC can talk by itself. My TNC does have a KISS mode, so I should be able to do it. I am currently running TCP/IP over an ethernet connection on the Internet. Since I already have TCP/IP software working, I would like to be able to use my SLIP server to talk to my TNC. I know about the ka9q/NOS package, and I know that it can handle the ethernet connection, but since I am running OS/2 instead of D(umb)OS, I would prefer to stick with the OS/2 TCP/IP package.

With that said, my question is: How would I go about setting-up this (or any other 'standard') TCP/IP package to properly transmit my callsign, etc for packet radio communication?

Another question would be: Does anyone know of an OS/2 version of ka9q/NOS?

Thanks in advance!

John

Subject: Sources for APlink executables
To: packet-radio@ucsd.edu

At the request of Ole, SV1BDS, I have uploaded a self extracting archive of APlink 6.02 to ucsd.edu. It is in hamradio/packet/tcpip/incoming. This is not quite current. Current is 6.03, but I don't yet have it.

Sources for the current version:

Quik BBS in San Antonio 512-690-5312 (8n1).
Compuserve's Hamnet forum.
On disk from TAPR $2 for 5 1/4, $3 for 3 1/2... plus postage outside .NA.
TAPR, PO Box 12925, Tucson, AZ 85732 (I have no connection with TAPR, and I doubt they are making anything off this at that price.)

My previous message to cut off for some reason, so here it is again :-(

I have read the discussion on this topic with interest.
Now that it seems to have died down a bit, i am wondering if
there was a concensus on anything ?
I for one would like to agree on some X- header to indicate BID,
so that we could forward some bulletins over Internet to gateway-systems
that can handle those headers appropriately, and pump them into the network
locally with proper bid. This would relieve the HF network and speedup delivery
(stuff like amsat buls with shuttle parameters comes to mind :-)

I'd implement it in my version of NOS, if we agree on something
How about 'X-BID: '

Subject: NOS for Microsoft Windows??
To: packet-radio@ucsd.edu

Hi
First I want to thank everyone who replied to my quest to find
WNOS. As I quickly found out WNOS is not a Microsoft Windows
program. What I would like to know is weather a Microsoft Windows
NOS program exists. I think one may since QST mentioned that
on page 92 of the March 1992 issue that a NOS for Microsoft
Windows has recently arrived. If such a program exists I would
be very intrested and would like to aquire a copy.
I would appreciate any information on this subject.

Thank you.

Whilst taking Gary's point that a simple audio repeater seems to be
just as effective, I'd expect that the best performance would be
obtained by demodulating the data and reclocking it. This would add
only a single bit delay to the signal, but would reduce the jitter
and distortion caused by passing through an extra pair of radios.
I'm surprised no-one has suggested this : is it any good in practice ?

At the opposite extreme, perhaps it would be worth repeating the signal
without ever demodulating either the data or the audio : regard the
repeater as a transverter with a very small shift.
I suppose voice repeaters don't do this as they need to do some audio
processing (tone decode on receive, ident on transmit, etc) but it
might be OK for a data repeater.

B.G. Micro (Dallas; 214-271-5546) is currently offering EPSON EG-7004S-AR
flat panel LCD graphic displays for $19.95. I bought two. They look
PERFECT for making a portable packet terminal (640 x 200 dot-matrix in
about a 11" x 6" size, total current draw about 20 milliamperes).

They came with a 27-page "manual" which is full of timing and electrical
specifications, but it would sure save me a bunch of work if someone who
has already interfaced one of these could give me a few suggestions!

Will anyone admit to having done such an interface?

Hello!
       I'm trying to put together a packet station from scratch after getting interested in it through reading. My budget is tiny :-), so I've obtained a secondhand Commodore 64 and am aiming at getting licensed in November when the next Uk Radio Amateurs Exam happens. In the meantime I'm looking for the Digicom software and construction details/schematic for its associated Bell 202 modem.

Can anyone send these to me or post info on where they can be obtained by ftp or mail file-server? The C64 will soon have an RS232 interface and then C64/128 Kermit, so downloads should be possible.

I'm interested in TCP/IP but participation in AMPRNET will have to wait until PC prices go lower.

Thanks in Advance!
                  Steve Rudman

PS If I've assumed wrong and Digicom is *not* freely copyable for am rad purposes then the address of a dealer stocking it in the UK would be useful.

 Janet: "hooke::icarus::rudman" @ uk.ac.ox.atm.isams

I posted this message to rec.radio.shortwave but I thought sending it here would help also.

I just got some software/hardware for my PC to receive weather facsimiles over a shortwave radio. I also just bought the shortwave radio, a Sangean 803. I've set up the software and the hardware, tuned the radio to a FAX broadcasting station with a strong signal, and have been able to receive faxes. My problem is some of the faxes received are very dark to the point they are unreadable. I would like to receive faxes consistently with the same quality. Is there anyone out there who has received facsimiles on their PC and might be able to answer some questions???

Some more facts:
The FAX stations I've been tuning to are coming in very strong (all five lights on the signal meter are lit) so I don't think it is my antenna. However, the antenna I am using is a simple wire one which is clipped onto the telescoping antenna of the radio. Would a better attenae help with receiving faxes or is a strong signal good enough?

The software allows me to adjust the white/black cutoff frequencies though I don't really know what the optimum settings for this would be. Should I adjust the settings for every new fax being received? Or is one setting good enough?

The PC is a Toshiba 1200 laptop with a CGA card. The monitor is a backlit LCD from which I don't expect much quality. I have a printer attached to the PC (a Kodak Diconix 150) which does a fairly decent job of printing those faxes which are of good quality. I hope its not the PC which is causing problems. The software came with files which contain sample faxes. These I have been able to display quite well.

Any help would be appreciated. An E-mail response would be best.

Thanks,
Michael

MDT = Mobile Data Terminal. It's used for getting calls, looking up
license numbers (the Fairfax police here just idley enter license
plates while waiting at lights to see if they get lucky). They also
can be used to order tow trucks (this is neat). They also have a
car to car chat mode so the cops (as in LA) can discuss how many
minorities they've beat up that day (it was totally beyond their
comprehension that all these communicaitons were being logged.

+---------------
| I've been waiting for all the real experts to get home from Dayton
| and answer this question, but since there's still no sign of them... :-)
+---------------

I'm not one, but I play one on radio. :-)

+---------------
| If all you need to do is read bulletins from someone else's PBBS,
| NOS is just fine; just use its AX.25 capabilities. But it sounds
| like you want to be able to collect messages on your own node; in
| that case, I'll let someone else answer the question of whether there's
| any version of NOS that can do that.
+---------------

Several versions of G1EMM and PA0GRI have BBS forwarding capability; PA0GRI
is more complete in that it can do hierarchical BBS addresses, but at least
the 2.0f version is said to be buggy. (I haven't tried it yet; the only BBS I
can reach readily won't forward to me due to the already existing traffic on
the frequencies he's on. I can well see the point, especially since I don't
see a real need for it in my case anyway.)

WB6HHV and I have come up with a mod for the K9NG 9600 bps modem (based
on some work by KD6HCN) that seems to improve the operation of the state
machine used to recover clock and do carrier detect.

The difficulty is that the K9NG uses a data slicer to directly feed the
state machine latch, so there is no assurance that the data transitions
will satisfy the setup and hold times of the latch input. This can lead
to some metastability problems with the state machine, resulting in
jittering of the clock, which can cause the descrambler to lose sync,
and also can cause chatter of the DCD output even on a good signal.

Since nearly all modern TNCs provide 16x clock, the flip-flop (U9b)
that was provided to divide the 32x clock from the old TNC-1 is
available for re-use. It is already clocked from the 16x clock; we
just cut and jump to insert it between the output of the data slicer
and the following circuitry.

1) cut the trace from U9 pin 9 to U9 pin 12, or bend U9p12 out of the
socket.

2) cut the trace from U9p2 to U7p13. Do that near R11 or where the
trace passes under R24. (R24 isn't needed and may be omitted in most
installations.)

3) add a wire from U2p2 to U9p9.

4) add a wire from U9p13 (or the 32x hole of JP3) to U7p13.

Seems to help - I think I'm seeing fewer retries. No parts needed!

By the way, the State 2.0 ROM used for the new TAPR-9600 modem will work
in the K9NG, except that DCD will false quite a bit. It's supposed to
improve clock recovery, so you might also give that a try. I found the
amount of DCD falsing to be unacceptable, so I'm not using it.
     - Brian

Hello Dick,

You should be able to change the settings of the PK-232 by using the
commands: param <interface> vhf off
     and: param <interface> hbaud 300

Did you try this? Doesn't that work?

73 de Adam PA2AGA.

I have a question with regards to linking the 232mbx to the 690s using
the ACC2 port. I have had no problems with the receive part of the
connectors BUT have had no luck in being able to get the 232 to
activate the transmit (PTT)line on the 690. The loop test with the 232 indicates
that all is fine with the audio output of the 232. In the manual the red or
number 5 wire is to be attched to pin 13 of the ACC2. AeA reps have
indicated that it can be attached to pin 9 instead. I've tried both and
have been unable to get the 2323 to activate the transmit action of the
690s even with the mic gain full open, and the AFSK output of the 232
turned full open. All other settings indicated in the manual for the rig
were followed. Yet NO power output or ALC action was displayed on the front
panel when I throw the 232 into the transmit mode (using "K" when in
 the dumb terminal which is in calibrate " CAL" mode).

Is it necessary to internally ajust the sensitivity of the AC2, am I missing a
switch in the 690s that must be turned on ???? etc?

I would appreciate any comments to be sent to me direct at SEELER@UPEI.CA.

Thankyou for your help in this matter.

This may be a silly question but,

Is the parameter XMITOK set to 1 on the PK232?

Great job Brian. This falsing in the new state machine can only mean
that they have the gain on the equivalent DPLL the state machine is
trying to emulate unacceptably high. It will result in quicker
acquisition but yield unacceptable jitter IF this is the case. Who
did the new ROM? I will make the mods to my two K9NG's and give
some feedback.

Both Paccomm and TAPR have little add ons that give a true TNC-2
style disconnect header to which the G3RUH (or NB-96 from Paccomm)
will plug directly.

I don't want to sound like too much of a neophyte, but...
before I came to college (5 years ago) I was quite active on packet
in the Chicago area. I also ran KA9Q NET.EXE and I really liked it.
I checked back there and I guess my old address is still valid, and
I'd like to run TCP/IP again. I guess now there will be more than
just 4-5 of us! Anyway, I guess now its called NOS, and I'd like to
know the latest and greatest version of this for the IBM PC and where
to get it from. I'm graduating and leaving May 23rd (goodbye Internet,
waaaaah!) and, being cheap, would like to know: (1) what to get..
(2) a good FTP site to grab it from...

Thanks in advance.

To my certain knowledge, the BBS moderators do indeed have restrictions on what is allowed on the boards...but like the FCC, they have a bit of trouble enforcing their wishes. They, like the FCC, depend mostly on the goodwill of the users. The whole concept of not taking responsibilty for a message you forward is difficult to defend. I could change "MYCALL" to anybodies I wanted, enter some drivel in a PBBS and you say that this message should be forwarded without any thought to content? Shouldn't somebody be responsible?
The most likely course the FCC will take, assuming that your opinion is the one held by most hams, is to shut down automatic forwarding of anything. What they don't want is more headaches from us...

>

What version of the Baycom software did you download? I know there is
now a version 1.5 which I haven't looked at yet. The earlier versions
had info on the modem interface in the doc files that were part of the
.zip file.

Basically Baycom similar to PMP except the serial port is used instead
of the parallel port. The serial port is not used in a standard way.
The DTR line is used for transmit data, the CTS line is used for
received data, RTS is used to control the PTT. The version of the modem
I have (from N4PLK) also has a connection to the normal TxD line, but
this is *not* used for data at all, it is part of a scheme to derive
operating power for the modem from the RS232 port.

You can't use a standard modem because the standard is Bell 212, which
sends data asynchronously, with stop and start bits. Packet data uses
another standard (202?) with a different way of encoding the data,
frequency shift rather than phase encoding. It also is a synchronous
protocol, meaning that the entire packet, up to 128 bytes of info plus
flags and header and trailer, is sent as a continuous stream of bits,
without stop and start bits between the bytes. In fact the concept of
bytes doesn't make sense, you can't just take every eight bits in the
packet and call it a byte, because the protocol inserts extra bits into
the body of the packet as needed to prevent the normal information from
erroneously duplicating the format of the flag which signals the end of
the packet.

Although the PMP and Baycom modems are similar, they are, unfortunately,
not identical. The basic modem circuit is the same, but the levels and
polarities of the control lines are different, and the PMP uses an
output from the modem chip to signal carrier detect, while the Baycom
doesn't use this and instead determines from the data line whether valid
data is being received. It would be possible to make a modem that could
be jumpered to use with either system, but as far as I know no-one has
offered anything like this to the public.

At first glance, this is a paraphrase of 97.113(f), and as such still may
conflict (IMVHO) with 97.109(e) UNLESS the packet system is classified as
a repeater -- even if it only uses one frequency. Not a very satisfactory
explanation. I too, am bothered that the ARRL chose to use the phrase
"other amateur's transmissions" rather than the current "radio signals".
Sounds like it is aimed directly at packet.

I think the current packet mode of operation should be explicitly recognized
rather than force people (even EICs) to interpret rules that clearly
do not directly apply.

I recently acquired a MFJ-1270 TNC 2 that I would like to hitch it to my
Yaesu FT-767GX for packet operation on 2m and 70cm. In reading through
the documentation for both the TNC and the Yaesu, I am trying to
determine what the best technique is to interconnect the two units.

According to the Yaesu manual:

     If the TNC has balanced AFSK tone output (that is, without

> any added de-emphasis), connect the AFSK signal from the
> TNC to the outer contact of the DATA IN/OUT jack: impedance
> should be 600 ohms, which corresponds with most TNCs. Output
> signal level from the TNC should be set to 30mVrms.

My question is "Does anybody know if my TNC fits this characteristic?"
Reading the TNC manual does not seem to provide this information, and I
thought I would ask before I attack it with test equipment to find out.

My option according to the Yaesu manual, is:

> If the TNC has de-emphasis applied to the AFSK output, the
> levels of the two tones will be different, and must be
> re-balanced by pre-emphasis in the FT-767GX. In this case
> connect the AFSK signal from the TNC for transmission to
> the PATCH IN jack (also 600 ohn impedance), but also adjust
> the TNC output level for 2mVrms _maximum_. The PATCH IN
> audio connects in parallel with the microphone audio input.
> A better solution is to remove the de-emphasis, if possible,
> and make connection as described in the predceeding paragraph.

I hoping that the first option presented is what I'll end up doing, but
if not I guess that it isn't a big deal...

Thanks in advance for any recommendations.

- Marc

A request for help: I'm a member of a group (that has, you might've
noticed, posted here b4... :)) that's attempting to implement ka9q so
that it will allow a remote computer w/ a packet connection to connect
to an Internet site... specifically, we intend to have the following
setup:

(1) remote computer... running ka9q, and w/ a TNC
(1) appletalk connected macintosh... running ka9q and connected *both*
      to a TNC and the network
(1) Internet connecected unix box... that, hopefully, the Mac will
      reroute incoming radio packets to, via the Internet.

Have people done this successfully? We can't even seem to get the
Macintosh to recognize it's connected to Appletalk... let alone the
Internet (let alone managing to get access to the TNC's from the other
groups who also are running up against the wall.... :(   ). *PLEASE*
respond via e-mail... We've got less than 48 hours...!

                                -et

Hi-

I have a couple of questions as a result of trying to implement the AX.25 Link-Layer Protocol. I'd appreciate responses from any who are willing to help me out!

I have a copy of version 2.0, October 1984, "AX.25 Amateur Packet-Radio Link-Layer Protocol" by Terry L. Fox (ARRL). Is this the most recent version of this document?

The document mentioned above wimps out on detailing the Frame Check Sequence (FCS) algorithm by saying "It shall be calculated in accordance with ISO 3309 (HDLC) recommendations." I've searched the local library, etc. and haven't come up with anything. So, where can I get a copy of the ISO 3309 document "Data communication -- High-level data link control procedures -- Frame structure"?

Thanks,
-Ross

P.S. I posted this on April 8th, but it looks like it didn't make it out, so here it is again. Sorry, if this is a duplicate...

At long last, the fully operational software is onboard the DSP2232. It does everything promised and more: It does two ports simultaneously with several modes paired. I am given to understand that the owner of LL Grace (and manufacturer of the DSP-12) has been telling people all over the world that the DSP2232 would never support dual ports as there wasn't enough time on the DSP chip. Hogwash. The chip has 50% of the ticks free when running a VHF modem on one port and HF modem on the other. At this time I am working on getting two 9600 bps modems to run. There the timing of events is critical. Each radio side has to be serviced at 76400 samples per second. With a trick I can do with one of the unused chip selects, I can see what kind of time the program spends in the idle loop. It is also spending less than 50 % of the time doing real work. However! There is extra overhead in servicing two different radios at once. BEFORE YOU BUY A Multimode controller of any variety, consider this box. It is definitely the most capable at this time. If you are going to the Dayton hamvention or to the LA hamvention, you will be able to see all the toys displayed. The modems onboard the last ROM I shipped:

Packet:

HF 300 bps, Bel202 1200 bps (both standard packet modes), 2400 bps (KAM 2400 or AEA PK-90 standard), PSK 1200 and 4800 bps, PACSAT modems at 1200 and 4800 bps, MSK at 1200 and 2400 bps, K9NG or G3RUH at 9600 bps. I have implemented a decision feedback equalizer in the G3RUH modem which GREATLY improves the copy of UO-22 for example. The dual port modems in the box at this time are HF 300 bps and VHF 1200 bps packet, two VHF ports, and baudot/amtor and VHF packet (what??? yes apparently this would be very popular with the DX cluster folks, we'll see). I am working on two 9600's side by side. Stand by for further news on this. On the dual port stuff, the host side software is FULLY operational. I monitor two channels at once without aid of special software and gateway from one side to the other is as easy as digipeating via the gateway call sign. (Look out KAM). We will support ALL HF modes paired simultaneously.

Baudot/AMTOR

There is every conceivable shift and tone pair and your favorite is not there, it is only software. I regularly copy 170/425/ and 850 Hz shift stuff listed in the listening times. There work as well as the PK-232 and can be made better when I have more time.

Miscellaneous:

Morse:

This turned out to be quite an interesting exercise. I did a neat trick that improved the performance of this demod over most that do morse. The real problem with others morse demods is that they are compromises; add ons as an afterthought because you cannot have a multimode without morse,

etc. This modem is killing an ant with an atom bomb, great filters, great algorithm for detection, etc.

Grey Scale Fax, and SSTV:

I implemented grey scale WEFAX, APT, and SSTV demods. I wrote an application to display these. The application needs work, the demods do not. If you are not looking at the weather charts or the sat photos, you are missing a fun thing. This box makes it easy. The standard will be made public so that others can do a better job than I since I have little interest in supporting such an application. The basic operation is quite simple: Data is sent out as 8 bit pixel values, this is frequency for the WEFAX and SSTV or amplitude for APT. There are several people working on the application for AEA and this has not all crystallized but the basic functionality is there.

Spectrum analysis:

I did a 512 point real valued FFT (using the old trick of doing it with a 256 pt complex) and then formatted the data to be sent out the serial port. This is displayed with an application I wrote. It is pretty neat to have amplitude and phase plots for you receiver looking at both known and unknown signals.

Automatic Gain Control:

There are several modes for which this is a must, there are several modes for which this is a bust (PSK from AO-16 for the former and WEFAX-APT for the latter or morse for examples). There is a no compromise attitude with this now. It drastically changes the performance of the modems. The modems are now stored with AGC state settings in them. There are several different AGC settings, off, on, more on, different time constants for attack and decay, etc. This was a brilliant piece of retro engineering for AEA by Al Chandler and it fits right into the existing units. If you have not gotten this retrofit, it is now an absolute must. Call them up and they will be happy to do it. By the way, if you have an application for which you do not want AGC or wish to provide your own, you can change the AGC from the command line.

DCD thresholds:

DCD thresholds are set from the command line. For those modems which operate on coherence of carrier detection or coherence in the data detection, you need to set the threshold for your radios. This is done via the command if you find that the default setting is inappropriate for your lash up.

Experimenters kit:

Many have asked me when and whether there would be an experimenters kit (you can download modems you write to the unit). I cannot give you an exact date. The fully operational stuff has been delayed enough that there has not been enough time to even think about it. Now that the major hurdles are behind us, we can begin to work on this in earnest.

The bottom line is that the unit is fully operational, and to my mind,
it now exceeds what I thought its potential would be. This is a function
of my having gotten better at DSP and the folks at AEA (Steve Stuart and
Al Chandler) working very hard with me. For those of you with the units
already, it is about to get amazingly better.

Stop by the AEA booth in Dayton and see it.

> Does anyone have NOS or ka9q tcp/ip running on Interactive 386 UNIX.

It proably would be more fun if you tried to interface the TCP that
comes for ISC to an AX25 driver. It probably wouldn't be too hard
to start from the SUN driver someone posted recently. I don't do
ANYTHING with ISC Unix anymore, there customer support people have
pissed me and our customers off too many times.

Now if it were SCO UNIX you were intersted in...

I just uploaded a new and hopefully finished version of my INTRONOS
introduction to ham tcp/ip document to the
hamradio/packet/tcpip/incoming directory at ucsd.edu.

This document is designed to serve as a standalone introduction for
packet radio users who want to get their feet wet with TCP/IP. It
is <not> a redraft of the reference manual.

The new version is called INTRONOS.NEW (until Brian replaces the old
INTRONOS.ZIP with this new version). It's a pkzip archive that includes
both an ASCII version and a Rich Text Format (.rft) version of the
document. The document is about 35 pages, the archive file about 54k
long.

I plan to distribute this more widely; I'll put it at least on
CompuServe and at the major ham radio BS systems. But it'll be a few
weeks before it's likely to get there, as I'm working out of town and
time is at a premium.

Enjoy!

I don't think this would apply to most packet stations. Packet stations
do not retransmit other transmissions -- rather they receive a packet
store it temporarily and then retransmit the packet.

Nntp-Posting-Host: hamp.hampshire.edu

In article <1992Apr19.194918.1@hamp.hampshire.edu>,
I wrote, in response to a query from moodyblu@camelot.bradley.edu about
hooking up a computer running BayCom to a modem and radio:

> The earlier versions had info on the modem interface in the doc files
> that were part of the .zip file.

I just unzipped the BayCom version 1.5 file that I had downloaded some
time ago and found that it doesn't even have a doc file in the usual
sense. It does have a large on-line help file that is designed to be
accessed from the program itself. There doesn't seem to be a general
description of the system or the operation of the modem anywhere in this
file however. It also has been translated from the German in a pretty
awkward way (which was true of the first version, too).

It's going to be hard for anyone to do anything with this without
information that is lacking. My own experience trying to communicate
with the authors of Baycomm, including sending them in good faith the
requested donation, is that although I did receive an update of the
program it took many months, and I received no response to any of the
questions I asked them.

I gather that the authors are annoyed about the way others have
distributed their work. In the new package they say in the README file

that they do not allow distribution in conjunction with any other product (I presume that would mean in conjunction with a modem kit) by anyone other than their authorized distributors, of which they apparently have one in the UK and one (PacComm) in the US.

It seems to me this is a little misguided. The circuit for the BayCom modem is very simple, even simpler than the sample circuits given for the TCM 3105 modem chip by Texas Instruments in their Telecommunications Circuits Data Book. The one element that is not in the TI data is the use of CMOS 74HC04 inverters to safely connect the modem's TTL level digital side to the +/- 15 volt RS232 levels of a serial port, but this is probably not original. The genius of BayCom (and it is a very sophisticated program, much more like a full-featured TNC than PMP) is the program itself. It seems silly to distribute this program as shareware and then to get upset about other people producing the modem and distributing the software along with it.

When I first became interested in BayCom a year ago I purchased a modem board from N4PLK. I don't know if N4PLK is one of those about whom the BayCom authors are now complaining. I certainly don't see anything wrong with his practices. He supplied complete information on the design of his board before I bought one, and the board itself was well made and was even sold with an offer to repair it in case of trouble or to refund my money if it wouldn't work with my computer. He also supplied a copy of the complete BayCom software on a disk, and there was nothing missing from it, all of the copyright information and requests for donations to the project were intact.

My advice to anyone considering Baycom would be to contact PacComm, find out what kind of support they are going to offer, but also to try to find and download from your favorite ftp site a copy of one of the earlier versions, 1.2 or 1.4, if only just to get some of the documentation about the modem interface which has been left out of the new version. Some time ago I placed a copy of BayCom version 1.4 on my local anonymous ftp area, /pub on dawn.hampshire.edu, and I will leave it there even though it is no longer the most recent version.

Someone posted a message saying he used Exar chips in a Poor Man's Packet
modem. He listed a Applications Notes number. Somehow, I wrote over
that saved file - I don't know how. Please repost that message!!!

The legal definition of a "repeater" is one I know we've bounced
around on the ARRL Digital Committee for some time without much
resolution. I think it's important because of the rules limiting
repeaters to certain frequency subbands. E.g., is a "digipeater" on
145.6 Mhz legal? The FCC has never really ruled on this issue.

I would like to see a "repeater" defined for the purposes of the rules
as a device that automatically retransmits signals *without being
uniquely and specifically addressed* in some way by the station being
repeated.

An ordinary FM voice repeater would certainly qualify, since there's
nothing special about the signals it repeats. (Ordinary PL tones
wouldn't qualify as "specific addresses" since they're not unique.)
But a digipeater or IP router would not be considered a repeater
because they don't relay traffic unless they are specifically
addressed and asked to do so, either by callsign or IP address (both
being unique). So you could put them anywhere the modulation method
is allowed.

A voice "repeater" that required some form of digital PL with unique

codes could also escape being confined to the repeater subbands. But
on the other hand, a simple "bent-pipe" regenerating digital repeater
would have to operate in the repeater subbands since it's not
specifically addressed by its users; there's no way that someone
transmitting on its input could ask it to not relay his signals.

I think this would be a good definition because the whole reason for
repeater subbands in the first place was to keep them off frequencies
where they might repeat signals unintentionally. This is simply not a
problem if the user has to specifically ask the system to repeat his
signals.

Phil

Pc Pakratt doesn't talk in kiss mode. When you enter KISS ON from
Pc Pakratt's Dumb Terminal the program aborts and exits due to a link error.
At that time run a KA9Q program. I do this by a batch file.
Then when in NOS and you want to exit to a non-kiss mode, tell the
TNC then exit, restart Pc Pakratt
(i.e. param ax0 255 ^M, tip tnc^M, KISS OFF)
then go to session manager (F10) and exit
Restart PcPakratt for non-kiss operation
If you revolve around two batch files and remember the above NOS command
you will always know in what mode you exited.
I usually exit in KISS (That is to say when I exit PcPakkratt
I do not restart NOS, or vice versa) Check it out.

The problem was, and still is, that the program Digicom was not being "freely distributed" but was being sold for between $50 and $75 with a $30 modem thrown in for free. The software should have separated from the hardware if it was to still be considered "given away for free". PMP will suffer the same fate. The modems are being given away with a $50 copy of the software to run them. The "correct" method of distribution if you make a product specifically for use with "freeware" is to make a software + schematic available for a nominal cost in addition to the product. An example of that is Tucson Amateur Packet Radio.

NO WAY. Get the proceedings of the ARRL computer networking conference that was held in 1989 (I think) in Columbia, Md. In it, Eric Scace has a state diagram description (a flow chart for a state machine) of AX.25 Level 2 version 2. It is the ONLY was to go in programming a version of AX.25. Call the ARRL and ask for the Computer Networking Conference proceedings that occurred in Columbia, Md (it is the green one ;-).

Bob

There was a problem with posting AX25 packet driver for BAYCOM-like
modem here so I uploaded it to ucsd.edu in hamradio/packet/tcpip/incoming
directory. At the same time I uploaded there PKTMON12 - a program
to monitor HF and VHF packet traffic with HamComm interface.

Mike,
The app note I am using is from May 1978 Function Generator Data Book
published by Exar. The app note is referenced as AN-01. I am using
a modem derived from this app note and it works very well. I am also
using a modem described in the original article which uses the TI
TCM3105 and it too works very well. Hope this helps. 73 Joe KE6HA

Al, read what you wrote 8-).
"Packet stations do not retransmit ... rather they ... retransmit the packet."

Maybe 'transmission' could be defined, but I prefer the old 'radio signals'.

Most packet stations (would like to) consider the message or packet as
originating at some other amateur's station. Therefore the responsibility
for content is (primarily) the originating ham.

Once again, I'm a member of a group that's attempting to use NOS to
connect from a remote computer, through a PC connected via ethernet, to
a Unix running machine... has anyone implemented this, and would they
care to share with us how? The documentation is unfortunately cryptic
on the matter (especially since we can't get the troff'ed version to
print correctly... and the PostScript version isn't all there... :( ).
We're past the bit about getting the machine to recognize it has an
ethernet card.. now it'll resolve, but can't establish a connection to,
the internet address we supply... do we need to put some kind of NOS
interface on the Unix box, too? I hope not.. shouldn't a telnet be a
telnet be a telnet?

Thanks,

Some preliminary tests of the driver indicated two problems:
1. Something was wrong with p-persistance scheme.
   I think I fixed this problem somehow but I'm not really sure...
2. Tx head (tx delay) was too short. Even it's maximum value (255)
   may be too short in some cases. I made it now two bytes value
   and put 500 as default.
Thus, I uploaded the "improved" version to ucsd.edu again.

Pawel, I would like to use your driver with the "Poor Man's Packet"
modem. The interface is via the printer port rather than the serial
port control lines as in Baycom. Would it be possible to get a copy of
source to modify for that purpose? I suspect there are a significant
number of the users of PMP who would like to use TCP/IP. TNX DE

> can I get a copy of the ISO 3309 document "Data communication -- High-
> level data link control procedures -- Frame structure"?

The AX.25 document didn't go into great detail in computing the CRC mainly because the standard practice at the time was to use commercial HDLC chips (Zilog SIO or 8530, WD 1933, Intel 8273, etc) and these all compute and check the CRC automatically. With the recent popularity of the "software HDLC chip" (a big step backward, in my opinion) I guess there's a need to define the CRC calculation in more detail.

Unfortunately the ISO spec might not help you a lot -- they're notoriously hard to read. A large part of the problem is that ISO spec-writers take pains to avoid discussing "implementation-dependent" details. But these are exactly the details that you, as an implementer looking for guidance, are probably most interested in! For example, ISO 3309 has an unusual (for ISO) annex titled "Explanatory notes on implementation of the frame checking sequence (Not part of the standard)". But it consists mainly of a page of algebra showing how a CRC can be mathematically represented as the division or multiplication of polynomials. The other page hints that the actual implementation includes a shift register, but nowhere does it show what the actual circuit looks like (a shift register with taps feeding exclusive-OR gates providing feedback.)

Useless. And perfectly typical for ISO.

Almost any textbook on data communications that covers link layer issues will have a much more readable section on how to generate and check CRCs than the ISO spec. There's a simple, brute-force way (one bit at a time) and a much faster way that requires look-up tables. You can find code that does the look-up table approach in my TCP/IP package on ucsd.edu (/hamradio/packet/tcpip/ka9q/src*.zip). It's in the PPP code contributed by Bill Simpson, file ppp.c. PPP is a link level protocol for sending IP packets over asynchronous telephone modem connections. It uses an "asynchronous" form of HDLC so it uses the same CRC-CCITT algorithm as AX25.

Before you distribute any code that does CRC generation in software, PLEASE make sure it can talk with a regular (hardware HDLC) TNC. It's easy to get the conventions wrong so your implementation will talk to itself just fine, but won't talk to anything else.

Phil

Subject: BBS name standards / Packet-BBS gateways
To: packet-radio@ucsd.edu

I recently put forth a proposal that packet bbses adopt a naming
standard such that personal mail could be inferred from the fact

that the recipient address contained a numeral, such as all
ham call do, and that "distribution" groups such as "AMSAT, ARRL, etc"
would contain *no* numerals.

A synopsis of the discussion so far:

To: durham@w2xo.pgh.pa.us
From: pitt!ve6mgs.ampr.org!mark (Mark G. Salyzyn, VE6MGS)
Subject: Wow
Status: R

Jim, marvelous idea ... no distribution name contains numerals, no
call letters contains no numerals. I like it. except, we
get a few distributions with numerals (9600, PNW7 ...), so I
would simply state that we use a short `legal call' algorithm
instead to weed these out. There was source for one posted about a month ago,
but a mistaken `find /usr/spool/news/rec/radio +45 -exec rm ...'
(instead of -mtime +45, I keep stuff around for 60 normally) when I
ran out of spool space today made mince meat of that idea !!! :-(

If not, I use a small call checker here that has not yet been tripped ...

Thanks for the idea, I will be changing the code today to reflect his
improvement. Your `problem' with NTS traffic ... ALL NTS traffic is
supposed to be addressed to the NTS<district> so ANY message with nts*
MUST be NTS traffic (unless, tee hee, someone decides to send a
bulletin to explain NTS operation and addresses it to NTS :-)

Ciao, 73 de VE6MGS/Mark -sk-

****

From: pitt!ve6mgs.ampr.org!mark (Mark G. Salyzyn, VE6MGS)
Subject: No numbers in personnal address on packet
Status: R

Jim, another `idea'. But this may be due to the nature of the gateway
I operate. Since our local BBS operator is overwhelmed with `just' the
normal packet operation, he is reluctant to support dropping messages
off directly in the TNC mailboxes unless they have a proven record of
being reliable. I, on the other hand, operate the gateway to allow
messages directly into mailboxes. A `popular' approach is to drop
the message off to the `person' rather than the `call'.

        SP DENNIS @ VE6PAW

as an example. The personnal mailboxes often do distinguish between
bulls and personals too. I don't think this is a problem at your
gateway (being centrally located, and used by people all across the
US), but it shoots holes in me using the number/no-number approach for
differentiating between bulletins and personal messages :-(.

Ciao, 73 de VE6MGS/Mark -sk-

****

AA4RE suggested:

>Alpha = bulletin
>alphanumeric = personal
>all numeric = NTS (at least US)

>Another NTS option is that they are all sent to
    xxxx @ NTSxxx

****

W2XO reply:

Parsing for a few exceptions wouldn't be bad.

There is perhaps a bigger problem with distribution names: How
do you tell that they are *packet* addresses? Mail comes in
from , let's say, lots of different sources/networks. Packet
mail can be parsed by inferring that it is packet mail from
".NOAM", ".AU", ".EU"... etc. Only as many cases to parse as
there are continents. There is no "H" address on a distribution name.
Should there be?

I guess one could parse for all the names.

-Jim
****

AA4RE reply:

>Well we could always make our own standard...

>   SB SALE @ ALLUS.Bulletin.ampr

>Roy

****

W2XO AGAIN:

Hurrah! I think that is may be just that simple.

The problem is really on the *RFC-822* side, not the packet bbs side.
If someone sent a bulletin from , say, the internet addressed this
way: all%allus.bulletin.ampr@w2xo.pgh.pa.us, I could easily parse it.

One nit-picky thing, I dislike "ampr" because it is too close to the
tcp/ip network name of "ampr.org". Maybe "amprbbs"

Hmmm... how about all%allus.$234567_w7kdj.amprbbs.bull@HOSTNAME

Sendmail here would immediately drop my hostname and
change the "%" to a "@", which would be:
        all@allus.$234567_w7kdj.amprbbs.bull

The mailer called by sendmail would then feed it to the packet
bbs as:
        ALL @ ALLUS < W7KDJ $234567_W7KDJ

On the "packet" side, using the "H address" field for bulletins
could work. This would eliminate having a big table of all the
distribution names (ALLUS, AMSAT..etc).

I can only speak for my software, but I assume that just moving the
H address parser higher in the parsing chain would allow the
bbs to recognize anything with ".BULL.AMPRBBS" as a bulletin, no
matter what the distribution name.

Hmmm.. if we used a scheme like including the BID in the H address
of a bulletin, it would make the BID field redundant 8-).

Am I off the deep end?

-Jim

  >
```

Almost ALL of the KAM commands regarding Packet operation are "standard".
About the only differences are things like "Status" instead of "CStatus".
PktGold is a specific package written for the AEA Host mode, there are

specific packages written to take advanage of the new (version 4 and later) Host mode in the KAM TNC. Hostmaster for example. Also, there are packages for multi-mode TNC's that are written to support all three. Lan-link by G3ZCZ is a prime example. PHS (written by the same person that developed THS for the DRSI cards) is a true multi-mode HOST package for the AEA PK-232. The major difference between it and PktGold is the $65 price. PHS is shareware. On the DCD, the KAM software is adjustable and has different settings for both the HF and VHF modes. The TAPR state machine is a fine part, but it didn't give 'true' DCD for HF operation without a. a second TAPR DCD board, and b. a lot of extra parts. Considering the added features of the 3.0 and later upgrades, the $40 for the EPROM was worth it. All that is required is some time to sit and adjust settings and take notes for comparing performance. A final note on the tuning displays. For HF packet and RTTY, the KAM display is much better than the PK-232. If you're used to a more 'traditional' cross type tuning scope, the filter output of the KAM is available, but not worth the additional effort. The 1278 has good internal and external tuning.

From: news-mail-gateway@ucsd.edu
Subject: Packet Repeaters
To: packet-radio@ucsd.edu

Up here in the land of the forgotten, we have some serious packet network problems. Everything presently occurs on one channel, 145.01. NET-ROM nodes, mail forwarding, three or four BBS, point-to-point chit-chat, at least two dozen personal BBS things, etc. The biggest problem is as soon as you connect to the local node and try to get into the local BBS, everybodys mail-forwarding and beacons and everything else comes alive, and you get re-tried into oblivion.

I have visited the Northwest and seen their excellent (IMHO) system where each node/BBS has its own (coordinated?) frequency. The mail-forwarding etc takes place on 220 or above, so you're basically on your own. I was definitely impressed.

Our local folks don't like this idea, but do want to set up a separate system for local use, especially for ARES/RACES type stuff. I suggested they simply put up another NET-ROM type node such as the 145.01 system, but they feel for some reason that they need a full duplex repeater.

My question to the net: Are there any real advantages/disadvantages to using a full-duplex (just like voice) repeater for packet. I know it is more expensive, uses two channels, etc., but I need more.

Please E-mail your responses as I don't often get time to read the newsgroup.

Thank you for any info.

73,
Michael

This always starts flame wars in the TCP Group mailing list when it
comes up, so I should probably be quiet. However, this is a pet peeve
of mine. While I very much appreciate all the hard work done by Phil
and others to make TCP/IP available on DOS platforms, it really is

a limitation on network *applications*. I'm playing with a AX25 driver
for SunOS that came down the net, and that may be the solution I'm
looking for, but it *does* require a Sun Workstation and most amateurs
don't have one sitting on their operating bench like I do. Plus there
are a lot of neat hacks in the latest versions of Phil's code that
apply directly to radio packet that are missing from the Sun TCP/IP.

I'm afraid that any Unix lookalike for Intel platforms that doesn't
support DOS emulation is going to meet with little acceptance among
hams. The commercial packages that do are terribly expensive, more
than the hardware in many cases. We really need a way for DOS applications
to talk to TCP/IP other than through Desqview loopback schemes. Turning
the present code into a device driver that a DOS program can treat
as a character device, or maybe block device, just like any other
device on the system, would immediately open up a whole range of
applications for packet. Applications programmers could treat the
packet network as a black box that responds like a terminal or a
disk. I see lots of uses for this.

Gary KE4ZV

Phil, I agree with the rest of your post, but the following comment caught my
eye:

In article <1992Apr22.182324.9358@qualcomm.com> karn@chicago.qualcomm.com (Phil
Karn) writes:
>With the recent popularity of
>the "software HDLC chip" (a big step backward, in my opinion) I guess
>there's a need to define the CRC calculation in more detail.

Waitaminute. I thought you were the one arguing that having special functions like that outboard of the CPU was an inefficient waste of hardware, especially since CPUs are getting fast enough to do the job and not impact the rest of the system. I agree that doing things like CRC in software is a Bad Idea; when did you change your mind?

Agreed I wasn't very clear. Let me try again:

A voice repeater retransmits the signal AS IT IS RECEIVED. You can think of the repeater as a bent pipe that takes the input signal and sends it out again unmodified.

A digipeater does the same thing an old-time traffic handler does. It receives the message (packet), stores it, and re-sends it later. I believe that the FCC definition of "repeater" no more applies to packet digipeaters than it would to traffic handlers.

Please clarify "big step backward."

If you consider the software TNCs a step backward because they have made the old, slow 1200 bps standard more firmly entrenched, you are probably right.

If you mean more than that, please elaborate. A DSP modem that implemented HDLC in software alongside the signal processing stuff might be a quite reasonable way to do things.

I'm currently writing some software to display the WEFAX data stream from my MFJ-1278 Multi-mode data controller on my Macintosh.

I've had some success, but would be interested in sharing code/experiences with anyone who's written software to work with the '1278.

Sure, I know I could just *buy* a program, but where's the fun in that?? :-) Any pointers to PD software of this type would be appreciated as well...

thanks!

Any interest out there in my Sony scanner--sane offers to my e-mail address. --Trades are possible, my interests include HT's, packet gear, and other resources to facilitate my finishing my small portable packet station. I already have the PacComm TNC, dual band HT, and HP95LX but I still need a battery source and small durable case, and possibly a solar panel :-).

--cheers (still waiting for my call)

cbnewsj!kb2glo
From: kb2glo@cbnewsj.cb.att.com (thomas.kenny)
Newsgroups: rec.radio.amateur.packet
Subject: Best of both worlds? (PBBS & TCP/IP)
Summary: PBBS with TCP/IP
Keywords: PRBMS PBBS TCP/IP
Message-ID: <1992Apr23.165800.16035@cbnewsj.cb.att.com>
Date: 23 Apr 92 16:58:00 GMT
Distribution: na
Organization: AT&T
Lines: 24

I've been using the PRMBS PBBS for about a year or so
and think it has a great user interface. However I'd like
to explore the world of TCP/IP and broaden my packet capabilities.
However I don't want to give up my daily reading of packet
bulletins... Since I don't know alot about NOS I may be
mistaken but I think NOS only handles mail and not the
bulletins that you would normally see on a PBBS. If I'm
mistaken please let me know. However I've heard that there
are some PBBS that can also do TCP/IP. So I wonder if there
is something out there that would fit my requirements:
PBBS email & bulletins, TCP/IP functionality (ftp, telnet, smtp),
land line support for remote login and PBBS message forwarding,
HamCall CDrom supported, and of course source code available so
I can hack it if I need something that isn't available.

Is there something out there that will do all or most of what
I'm looking for or am I asking for to much???

Thanks in advance for your reply. 73, Tom KB2GLO.

What about "bent-pipe" digipeaters? They exist... Oh, all right, there
is a bit's worth of delay, but surely there's a few nanoseconds delay on
a voice repeater...

Subject: Note for TPRS Report
X-Mailer: IM/Mac 1.0b20

Carl, suggest the following PK-232 tip for the next TPRS Report:

       ---------- IS YOUR PK-232 GOING DEAF? ------------
                              By Dick Kriss, KD5VU

My PK-232MBX was slowly going deaf. The transmit was okay, but I was having
trouble receiving packets. I would connect to a station and get good ACKs, but
was having trouble printing them and since I was not receiving their packet,
they would time out waiting for me to ACK. This problem did not happen over
night but seemed to degrade with time.

Called AEA and the technician suggested I change out U-20, MC-1488. I used a
Radio Shack 276-2520 Quad Line Driver. It worked! I have to admit it was not
easy to remove the old IC that was soldered to the board. It now has a socket!

If your PK-232 seems to be going deaf, consider replacing U-20. Much thanks to AEA for the tip. Save me having to send the PK-232 off for repair.

Terminology clarification: digipeaters are store and forward - they inhale a whole packet and spit it out after it has been completely received. They update the 'digipeated' bit in the packet headers. They employ shared-channel access methods, such as CSMA/CA. They do NOT repeat bits instantaneously.

A real-time repeater is NOT a digipeater, even when it's repeating packets and/or other digital communications.

Forgive me if I'm confused, but I think that this was not a case of your
PK-232 going deaf, but instead becoming mute. The MC-1488 is (I think)
an RS-232 line driver, meaning that it was used to speak to your computer
on the serial port. So I think your PK-232 was hearing ok, but it wasn't
able to communicate what it heard from the radio to your computer.

Not that this is a big deal, but I think it is important for anyone wanting
to do this to understand what they are "fixing" by replacing this chip.
If your real problem is lack of receive sensitivity, I don't think replacing
this chip will help.

Awhile back (either here or on the HAM policy list) there was a posting
about a boy name Craig Chergold (or something similar) who was
collecting business cards to get in Guiness because he had a terminal
disease. The posting asked that these types of requests be ignored when
seen on packet or elseware because they were stale and being
recirculated again and again. I've seen one again, could someone either
direct me to where I could get a copy of the original post debunking
this or send me the info contained in that post so that I can provide
concrete information to those that are continuing to recirculate this
request.

There is a simple solution to COR-operated RF amp keyup delay - use
direct PTT.

However, many COR's may be minimally modified for substantially
shorter keyup delay by simply tweaking a capacitor or 2, altering a
resistor or 2; or (better yet) getting rid of the clanker and using
PIN diodes, a move usually appreciated by XYL's if your shack is
adjacent to your bedroom and the local insomniacs victimize your
machine in the middle of the night =8-O

I have managed to get my PacCom TNC220, which is suppossed to be
user interface compatable (more or less) with a TNC2, into the KISS
mode. Works great for tcp/ip etc. I can`t find any documentation
that tells me how to take it back out of KISS mode. Any hints?

In article <12118@ucdavis.ucdavis.edu> ford@eecs.ucdavis.edu (Gary Ford) writes:
>I have written a document entitled "Beginner's Guide to TCP/IP on the
>Amateur Packet Radio Network Using the KA9Q Internet Software."
>Version 2.0 of the guide documents the use of NOS 911229 (PA0GRI v2.0h)
>and BM v3.3.2.

If you've never seen Gary's guide, be sure to pick up the latest version.
Ever since he released the first version, I've been recommending it to
incipient Mac TCPers (even though it doesn't really talk about the Macintosh
version) because it's such a well written introduction to the KA9Q program.
Five stars, highly recommended.

Patty

p.s. Of course, I've also been recommending it to incipient non-Mac TCPers.
I just don't like to admit that I know any... :-)

                        MEMPHIS MINI-FEST 92

There will be a MINI-FEST at State Technical Institute-Memphis on April 18th!!

State Tech is located just to the south-west of exit 12 on I40 in east Memphis. Talk in will be on the W4BS repeater system, 146.82, 224.42 and 443.2.

Table set-up begins at 8:00 and the doors open for general admission at 8:30. For table information, please contact KC4ZOV @ W4BS via packet or 901-363-3159 via land-line. Tables are $5.00 and admission is $2.00.

The following is a list of ONLY those forums that are confirmed AT THIS DATE. Others are in the planning stages. All forums will be in the Engineering building at class rooms indicated by LOCATION.

TIME	TITLE	LOCATION	PRESENTER
09:00	Eastern Ark. Emer. Preparedness	F112	by Wayne, N5JLJ & Joe, N5MIG Phillips County Arkansas
	HF Digital Modes	F116	by Hugh, WA4SLI
10:00	Shelby County RACES	F114	by Dana, WI3B Shelby County RACES Officer
	Army MARS	F118	by Pat Lane, W4OQG
11:00	Tower Legal Issues, etc.	F112	by Dwayne, KC4POI ARRL Volunteer Counsel
	Beginner's DX Forum	F116	by Dennis, WF4G
12:00	VE Testing	F118	by John, WZ5S & Dana,WI3B
13:00	BBS Access & Activity (panel members)	F112	by Buddy, WX2G, Suresh, N9GSA (W4BS) Tom, KA4P (KA4P, Trenton) Roy, WX2B (WX2B, Memphis) Harry, AI5R (AI5R, Lakeland)
	ARES Forum	F116	by O.D.Keaton, WA4GLS, ARRL Tennessee Section Manager & Steve, NX3W, Shelby Cty ARES EC
14:00	VHF/UHF Forum	F114	by Dave, N4MW ARRL Technical Coordinator
	Antenna Forum	F118	by Rodger, K4HTB
15:00	W4BS Packet Repeater	F112	by Steve, KM4WQ & Terry, KB4KA
	Antenna Forum (Cont)	F118	by Rodger, K4HTB

Additional forums we are trying to confirm are:

Weather Service - Warning & Preparedness
ATV Repeater
DFing (Fox or Rabbit Hunting)

We hope everyone will attend the Mini-Fest and as many forums as possible. You cannot find a less expensive way to learn more and increase your enjoyment in our Amateur Radio hobby!

The doors will close at 4:00 pm. However, there will be a sysop's meeting for BBS, THENET/NETROM and ROSE sysops at 5:00 pm. See me for details on the sysop meeting.

Hope to CU there, 73, Terry KB4KA

As quoted from <48943@wd6ehr.ampr.org> by wd6ehr@wd6ehr.ampr.ORG (Mike Curtis):
+---------------
| If NET/NOS stations use mode VC, they will be more aggressive and have
| a more equal footing with ax.25 stations.
|
| If ax.25 stations run sensible settings, they won't preempt tcp/ip
| activity that much.
+---------------

I see you've never experienced a mixture of exponential- and linear-backoff stations on a single channel before. I have. The result is that the exponential-backoff stations essentially lose the frequency because the linear backoff scheme is inherently more aggressive. Even on mode VC connections: a simple AX.25 connect from an exponential-backoff NOS still loses the frequency to linear-backoff stations.

I managed to find the KA9Q's source for version 6.18 on ucsd.edu (after remembering I had the old FAQ that was posted in November of last year (perhaps an update is warranted? with more info in what is in those archives?).

Anyone know if there have been any major bug fixes to the TCP/IP, KISS, or AX.25 code since then?

Any help much appreciated.

Richard

Well the data engine finally arrived and I purchased a
Alinco DR1200 data radio for the 2 meter side, waiting
on a DR4-10 for 19.2Kbaud... I was wondering

if anyone else was running a 1200 w/ a Kantronics product..
If so, what are you running for TX audio levels and Equalization...
I'm running max audio and partial equalization...seems to work,
is this correct?

Hi Ted. I believe the correct syntax is...
hamcall@hamcall.ampr.org. For me that would be
wa9wcp@wa9wcp.ampr.org. You'll see things like
ken@wa9wcp but that's a local issue and requires
an alias file to translate ken back to wa9wcp.
I have the full blown wnos3 including source code
but it has to bee compiled with Turbo C.
Ken wa9wcp@wa9wcp.ampr.org or WA9WCP @ W9ZMR.IL.

Lines: 23

I just pulled down the G8BPQ node software, and noticed that it has an
interface to run NOS under it. The documentation implies that this is for use
with e.g. DesqView; a local ham, however, tells me he runs NOS under DesqView
without G8BPQ and without difficulties.

Anyway, my questions are:

(1) What benefits are there from running NOS under G8BPQ?
(2) Are there any special circumstances when use of G8BPQ with NOS is a
    particularly good idea? Or a particularly BAD idea?
(3) Is there any documentation for G8BPQ that is somewhat better assembled
    than the docs in BPQ405.ZIP? (I didn't think anything had worse docs than
    NOS! ---now I know better.) I suspect I wouldn't be driven to ask here
    if the docs that came with it did a better job of explaining the benefits
    of the G8BPQ software.

I should mention that I've already asked locally; nobody around here uses it.
(I thought for sure KB7YW would be able to give me pointers; ah, well.)

In serveral cases, people have had great success running BPQ,
DV, NOS, and an AX25 BBS such as mine on a single computer.

So the advantage to using BPQ and NOS is that it allows those ports.
to be used by other programs

Has anyone had experience with adapting the Alinco 110 vhf mobile radio to
9600 baud packet operation? How about the Kenwood 7950, 7850 or 7830?

Well my first try got 0 responses so try again :-(.

1. What is the prefered protocol for smtp mail addresses?
   handle@host - ie ted@n6trf
   callsign@host - ie n6trf@n6trf

2. Several of the pars group have been experimenting with ka9q and all
   phils children. However our problem (or apparent) is we cant get out
   of our valley direct to another tcpip station. The way it appears to
   me that shuts down all the good stuff. Educate me please on how we can
   do tcpip connections via netrom (or whatever).
   Remember ignorance can be educated but stupid is forever :-).

I've been using a GE MVP for packet, and plan to use the radio as
the basis of a duplex data repeater. The MVP is a compact commercial
radio with a front end consisting of a 5 section helical resonator
followed by a JFET mixer. The service manual species a JFET "similar
to the 2N4391" as the part.

The 2N4391 is a switching FET, not normally specified for RF service.
I've started wondering if I could lower the front end noise figure, or
improve the gain without compromising dynamic range, by replacing this

FET with a healthy RF FET like a U310. I haven't compared the
transconductance and threshold voltages to guess at bias changes,
but I don't think that is too much of an issue.

  Before I charge off, has anyone here had experience with this?

This is an addition to David's request. I have the feeling that a _low_
speed packet box, such as a PK232 using the HF interface, should be able
to be connected to a telephone line using a fairly simple circuit.
They will handle all sorts of tone pairs and have built-in Baudot conversion.
Couldn't you use the HF interface to run TDD service to a deaf friend and
still have the VHF interface to run 1200 baud to a radio?

I have a deaf friend who is at this moment studying for his n.c. tech license
so that he can run packet. With the digital modes, there is no reason a
person actually has to HEAR a radio to be a ham!

I also want to do a similar hookup for TDD access to the timesharing
computers here at the college. TDD modems are freighfully expensive --
over $300 for a 45.5 baud half-duplex modem is robbery. If one/some of us
hams can come up with a better answer we will be doing a really good deed
for a segment of our population who could use a little help.

Anybody got any good ideas? I will collect them, and if anything really neat
comes up will forward to my local defnet BBS.

Greetings net!

I have seen some kits and home-brew articles regarding Bell 202 modems like the Baycomm board in the periodicals recently. From I gather these kits that use either a TI chip or AMD chip are just modems and you need to run a package on an IBM pc or clone either called Poor Man's Packet or the like. Are there any Macintosh packages written or in the process of being written to interface with these modem boards. any posts or replies would be appreciated...

73,
Ken Lewis

In the San Jose area, it seems to be personal preference. I use my
first name, some other folks do the same, others use their callsign.
(And, at least in the Macintosh version of Phil's package, you can
set up aliases so that all incoming mail lands in the mailbox of your
choice, no matter which user name it was sent to.)

Note, however, that if you're sending a message to an AX.25 user
(do you have a TCP-to-AX.25 gateway in San Diego?) you *have* to
use callsigns because the AX.25 BBS software will freak at anything else.

>   Educate me please on how we can
>   do tcpip connections via netrom (or whatever).

I thought this was in the main KA9Q manual. If not, it's in a supplement.
Try rooting around the ka9q directory on ucsd.edu.

Patty

Mike,
Not sure if you received last reply. I am using a modem of my own design
which was adapted from the exar 2206/2211 app note. I am using this with
pmp v1.1 and have excellent results. If you need a cop of the article from
Aug 73 or the S/W let me know. The S/W is available off the Hamnet BBS
at 2169426382. By the way I could use some 2206's & 2211's.

Hmmm... Wouldn't the linear-backoff people time out first? I'm one of
the few people in my area using p-persistence, and it seems that under
heavy congestion, the FRACK/DWAIT brigade time out before I do...

Hi all
Haveing had a NULL responce from contact with FLEXNET Group in Germany
I wish to Know if any one else in the World has had any Luck?? Ive written
Emailed ax25 and visited the so called place where its sold and Sitll come
come up with a big Nothing..
I would like to make contact with BAYCOM Group now to get info on the
BAYCOM-NODE think the latest version is Ver 1.5f it compatible with FLEXNET
but with out the hassel of getting the software and the hardware
So has any one any contact info THAT is reliable and Likley to respond to
Questions.. for BayCom-Node software and SCC hardware
OR: if any one has had suscessful contact with the FLEXNET Group.
Thanks
Email only replies [btitmars@esoc.BITnet] GM8SAU

Browsing around on ucsd.edu, I've noticed that there are a quite
a few KA9Q-NOS derivatives and ports available. Many of them
provide little documentation, not even a readme with a "What this
is" statement, in the ftp directory. Is there any sort of a guide
available for what version of NOS does what?

Don Loflin
loflin@sirius.cc.utexas.edu

P.S. If there's a KA9Q/NOS specific mailing list, could someone send me
the address?

This is an entirely local thing with EACH INDIVIDUAL STATION.
I and one other here (I'm running net under unix; he's running NOS under
DOS) use our first names as the primary mailbox and have (since the
"safe" custom seems to be callsign@callsign.ampr.org) aliases to point
the callsign to the name. In the case of unix, there isn't a user here
known as "k6jrr" - the callsign is almost always an alias. Just as in
internet mail you are supposed to support mail to several addresses that
are almost always aliases, ("postmaster" is one), hams "should" support mail
to their callsign, either as an alias or mailbox.

>ken@wa9wcp but that's a local issue and requires
>an alias file to translate ken back to wa9wcp.
That can vary (see above). One should support mail to his callsign, and if
you mail to someone you don't know, it should be "safe".
If you prefer mail to some other name, either your "from" or "reply-to"
lines should reflect that, or your signature line(s) should.

>TNC.

Well, I'll take a stab at it.

NOS This stands for Network Operating System, a bit of braggadocio
describing the latest versions of Phil Karn, KA9Q's, implementation
of TCP/IP for amateurs. It's a program that runs under DOS on PCs
that implements the TCP/IP protocol stack and several clients and
servers such as telnet, ftp, and smtp. Older versions of the program
were simply called NET and have been ported to the Mac, Amiga, and
various Unix boxes. There are now several flavors of NOS by different
implementors. They all interoperate and generally follow Phil's
original work.

TCP/IP Transmission Control Protocol, Internet Protocol. This is a protocol
stack originally developed for DOD use to interconnect different
computers over diverse link level networks. In amateur practice,
it allows data streams to be interchanged between different kinds
of computers over the AX25 link level networks. It is nominally
a datagram system that theoretically has the ability to route
each packet individually over the current best route while maintaining
data integrity through end to end acknowledgements. It is the most
widely used computer networking protocol stack.

TNC1 This is an obsolete bit of hardware developed by TAPR, the Tucson
Amateur Packet Radio organization. It was the first widely available
TNC kit based on a Motorola processor.

TNC2 This was the second TNC designed by TAPR. It and it's clones are
the standard amateur TNC. It's based on the popular Z80 chipset.

KAM This is one of the wonder boxes, others are the AEA PK232 and

the MFJ1278. These so called multi-mode units can do packet, RTTY, WEFAX, and CW. (A personal aside: like most do everything systems, they do nothing particularly well.) They are fine for people who wish to sample several operating modes.

Softkiss connects a modem directly to a macintosh. This saves having a
TNC. Softkiss will work with 300 baud HF, 1200 baud VHF and higher
baudrates. The software is in the early stages of development and is
not useful in everyday work at this time.

You can send test packets and recieve/print packets at this time.
The test programs are available via anonymous ftp from host
akutaktak.andrew.cmu.edu [128.2.35.1] in /aw0g/softkiss1f.hqx

Changes since the last release: You can test transmit, recieve,
interrupts, dual port simultainious recieve, support 300 baud,
use power manager on power books/portables.

If you are working on hardware and want to test your hardware
pick up this release. If you want a complete usable software package
wait for a later release.

1 813 874-2980 Business office
1 813 875 6417 Technical support
1 813 872 8696 Fax
1 813 874-3078 E-mail

They are now 'the' source for the BayComm group. They (PacComm) have signed
an aggreement with them (BayComm) to handle their product line of hardware
and software.

[Note: Editorial opinion follows]

From the beginning, Florain, DL8MBT and the others have devoted a HUGE amount
of personal effort to Digicom and (now) BayComm and have seen others make a
large profit from their efforts. BayComm has gone commercial to help defray
the costs of development, and have chosen PacComm to act as their distributor.

[End of opinion, return to real world]

Occasionally I see mention of 2400 baud in the ham packet literature,
but I haven't been able to tell when (if ever) it is used.

Does it make any sense to bother getting 2400 baud equipment, or
is everything at 1200 & 9600?

And is all TCP/IP at 9600 and above?

Plodding along at 1200,

A Blow-By-Blow Account of the 1992 TAPR Annual Meeting
==========

The following is based on the notes I took during the TAPR annual
meeting. Any mistakes are mine. On no account should you assume
that this account represents the official position of TAPR or anybody
else. But I hope you find it interesting. You may publish parts or
all of this document if you wish, but if you do please credit the
SANDPAC Newsletter. Sorry it took so long for me to get these notes
published this time.
         73 -Paul Williamson, KB5MU

The 1992 TAPR Annual Meeting was called to order by TAPR President
Bob Nielsen, W6SWE, on March 7 at 9:41AM at the Inn At the Airport in
scenic Tucson. He introduced Master of Ceremonies "Packet" Pete
Eaton, WB9FLW, who introduced TAPR Office Manager Heather Johnson,
N7DZU.

Heather welcomed everybody to Tucson. TAPR office hours are Tuesday to Friday, 10 AM to 3 PM. Thanks to Bob Nielsen, W6SWE, for his work as President of TAPR. Thanks to Pete Eaton, WB9FLW, for taking care of TAPR's presence at the Dayton Hamvention. Thanks to Ron Bates, AG7H, for fielding technical questions. Thanks to Dave Medley, KI6QE, for fielding questions on the PK-232 DCD mod and the PSK modem. Everybody hates not to have the latest version of software, so thanks to the new librarian, Lou Nigro, KW7H, for updating all the software in the TAPR library. Anybody who has software that should be in the TAPR library, contact Lou. And of course, thanks to Lyle Johnson, WA7GXD, for fielding the daily barrage of miscellaneous questions. The new TAPR 9600 baud modem is available now at $70, and the Trakbox is available now at $185. Thanks to everybody associated with TAPR for being fun to work with.

Bob Nielsen, W6SWE, took the microphone again, and asked everybody to introduce themselves. 112 of the usual suspects from all over the place were present. Nielsen then announced that the TAPR Board of Directors had been resized to 9 positions. The new officers are:

President:	Bob Nielsen, W6SWE
Vice President:	Dave Toth, VE3GYQ
Secretary:	(open, volunteers?)
Directors:	Tom Clark, W3IWI
	Jerry Crawford, K7UPJ
	Jack Davis, WA4EJR
	Pete Eaton, WB9FLW
	Greg Jones, WD5IVD
	Dan Morrison, KV7B
	Harold Price, NK6K

Bob Hansen, N2GDE, will continue to serve as editor of the Packet Status Register. Lou Nigro, KW7H, will take over as software librarian.

Pete Eaton, WB9FLW, took the microphone at 10:00 AM. For the first time, this year's TAPR meeting is recorded by a printed Proceedings. Thanks to the several speakers who managed to submit papers for the Proceedings. He then introduced the first speaker:

==========

Lyle Johnson, WA7GXD
TAPR's New 9600 Baud Modem - What It Is, What It Isn't

TAPR's new 9600 baud modem is compatible with existing K9NG and G3RUH 9600 baud modems. It's an inexpensive kit, capable of full duplex operation (like the G3RUH but unlike the K9NG), with improved DCD (data carrier detect) performance and clock recovery. It looks up the transmit waveform in ROM, like the G3RUH, and has a frequency response compensation adjustment on the receive side. The board is designed to mount internally in a TNC-2 (where it's a tight squeeze) or a PK-232. The board includes provisions for bit regeneration

(parts optional) for use in a full duplex digipeater.

There are about 5000 G3RUH modems in service overall. Heathkit is mostly out of the kit business, so one of the goals of the 9600 baud modem project was to leverage TAPR's expertise at packaging kits to make available a 9600 baud modem with better performance than the K9NG at a reasonable price. The design address problems with the K9NG modem (like its half duplex design) and adds features for network builders (like the bit regenerator). The state machine in the K9NG could mistake silence (like a squelched radio or a weak carrier) for a data carrier, thus holding off transmission indefinitely. The new state machine design cures that problem, and also gives better clock recovery.

A block diagram of the modulator portion of the modem was displayed. The modem disconnect header (TAPR standard or PacComm extended) goes into a data scrambler, to the transmit waveform ROM lookup table, to a digital to analog converter, through a filter, and out to the radio. The clock can be obtained from the modem disconnect, or generated on the 9600 baud modem board. RTS from the TNC controls PTT through a watchdog and an LED indicator. Programmable logic provides switching from the 9600 baud modem to the TNC's internal modem. It is still necessary to hook up the modem directly to the discriminator and modulator inside the radio, not to the speaker and microphone jacks.

A block diagram of the demodulator portion of the 9600 baud modem was displayed. The input buffer has a high input impedance, 100 kohm or more. A Butterworth 6kHz filter is tweakable to compensate for the frequency response of the receiver, which is especially useful with rigs with LC filters like Mitreks. The data slicer feeds a descrambler, state machine and DCD circuit, with an output for a bit error rate test. The DCD detects synchronous transitions, rather than the lack of asynchronous transitions as before.

Block diagram of the bit regenerator. It consists of a PAL and a FIFO chip. The FIFO inserts a nominal delay of 8 bits, and is required to eliminate bit jitter and timing errors in the received signal. The result is that if the repeater can copy the input signal at all, it will transmit a perfect signal. A diagram of the switching configuration shows how the bit regen is connected with the TNC, so that the TNC can transmit on the channel instead of the bit regenerator.

A sample of the 9600 baud modem was passed around the room. It's a four layer PC board, which helps cut the RF noise. It's relatively compact, but it has a lot of parts on it. The documentation shipping today is preliminary, and needs more information on hookup to various TNCs and radios. Updated documentation will be sent to early buyers.

Question: I'm interested in higher speeds than 9600. Is this modem planned to be scalable to higher baud rates?
Answer: It hasn't been tested, but it should work. The op amps and the

ROM lookups are plenty fast. The input analog filter would have to be adjusted. The transmit lookup table might help at higher speeds to compensate for the nonlinearities of a wider filter. We should try that experiment.

Question: Has it been tested on the satellite? How does its performance compare to the G3RUH?
Answer: It hasn't been tested on the satellite yet. Lab bench tests aren't realistic, but they show that the new modem is no better than the G3RUH, and 1 to 2 dB worse under some conditions.

Question: The PK232 limits the TBAUD (computer to TNC) rate to 9600. Does this cause a problem when using the PK232 with a 9600 baud modem?
Answer: We haven't noticed any problems in testing. Probably the worst thing is that you won't be able to keep the pipe completely full on transmit, resulting in dead time.

On the PK232, the ALTMODEM 1 command permits the user to switch to the 9600 baud modem from the keyboard. This means you effectively have a third radio port, because you can leave the PK232's two existing ports hooked up to other radios.

TXD (delay between PTT and first data) is another issue. If you have the state machine DCD mod kit in your PK232, there's a small extra delay that requires increased DCD at the other end. With a TNC-2 or a Kantronics DataEngine we could run TXD of 1 or 2.

Question: Has the modem been tried at 4800 baud on the 6m backbone?
Answer: No.

==========

Dewayne Hendricks, WA8DZP
Use of CDMA Spread Spectrum in the Amateur Service

Last year at the TAPR meeting, we talked about Part 15 spread spectrum (SS) communications systems, and displayed a low-cost commercial product capable of high data rates. The year before that, N3FCT presented a paper on license-free spread spectrum. Folks in the San Francisco Bay area were inspired to look at the Part 15 market. The results of a field test of units from Proxim was posted on Usenet. One watt into a 6 dBi antenna gave 2 miles LOS tested and 8 miles LOS predicted at 121 kbps. There's been lots of activity in the wireless LAN market and at the FCC since then. We wanted to find out why the amateur radio service isn't using SS techniques, and approach the FCC for whatever rule changes are needed. An STA (Special Temporary Authority) for testing was sought and obtained.

A second generation Proxim unit was passed around. It is a 121 kbps data radio (data in, antenna out) in a very tiny box. In the OEM package for laptops, it costs $50. The internal modules of the Proxim radio were displayed - all very tiny. Computer manufacturers are starting to put these directly into laptops for wireless LAN

use. Challenge to ham radio: get coordinated with the computer BBS folks and build a wireless Internet.

The ARRL Spread Spectrum Handbook is good for a basic tutorial and for historical information on SS. AMRAD did the experiments that led to the current rules permitting SS. The present rules are like handcuffs. In particular, they mean that amateurs won't be able to use commercial SS products, because they don't happen to use one of the few spreading sequences permitted by the rules. We decided to seek a rules change. This turned into a long process. It turns out to be important to use connections in rulemaking matters. After last year's meeting, Paul Rinaldo, W4RI, at ARRL HQ was approached for, and arranged, ARRL cooperation for an STA submission. After several months, and polishing by the League lawyers, the STA application was submitted to the FCC, which promptly sat on it and did nothing.

About this time, the League managed to get FCC Chief Engineer Stanley to speak at the Computer Networking Conference. Stanley is a proponent of spread spectrum, and he was interested in the amateur proposal. He assigned a staffer to the STA. The STA requested a two year authorization for any spreading code on any VHF or higher band. Before the STA could be approved, the staffer had to get every agency involved with the use of any of those bands to accept the proposal. It was a lot of work, but with support for Stanley and the League is was done. The STA was granted.

There are plans for tests in at least the Northern and Southern California areas. People interested in serious experimentation with SS can be added to the STA. The intention is to eventually submit a Petition for rulemaking to get a better set of SS rules. The restrictions on spreading codes and the requirement for narrowband station ID are particularly onerous.

One test is starting in San Diego, under the California State Library project for packet radio. Using radios produced by SRI, the project will interconnect libraries to the wide variety of online databases available via the Internet, without the cost of a 56kbps landline connection to the Internet. The pilot project in San Diego is sponsored by Apple Computer, and radios have been donated by Tetherless Access (Hendricks's company) and by hams. Parts of the network are operated under Part 15 (license free), Part 97 (amateur), and Part 5 (experimental).

Funding has been allocated in the Bay area to connect 100 libraries from San Jose to Roseville, San Francisco to Sacramento, all in one WAN. Part 97 (amateur) radios are to be used for long haul links, and Part 15 radios for intra-city links. This experiment will last through the end of the year. Phase II will involve redesigned 1.5 Mbps radios and associated networking software. Currently the project supports only Macintosh computers, partly because any Mac off the shelf can handle up to 900 kbps data links. Hams in northern and southern California will be seeded with equipment to try out Phase II.

There's a lot of work to do. First, get the FCC rules changed. That will take 1 to 1.5 years, on the fast track. It is hoped that the rules will be changed before the STA ends. Then hope that manufacturers will go after the ham market. We haven't done a good job of keeping the FCC up to date. We need to tell the FCC where the public interest lies. The FCC wants to help, but we have to play the game: STAs, Part 15, waivers, and so forth.

Question: Is all the Part 15 activity at 900 MHz?
Answer: No, we're not using 900 MHz at all. We are currently working at 2.4 GHz, and have plans for 5.7 GHz.

==========
Fried Heyn, WA6WZO, ARRL Southwestern Division Director

Read the Division newsletter for more about what's going on. Some high points:
There's a bill in Congress that can protect amateur frequencies from further erosion.
A big effort funded by the ARRL membership was directed to preserving amateur spectrum at WARC-92. The results are not final yet, but it appears that no amateur spectrum was lost at the conference!
The 1992 ARRL National Convention is at the Los Angeles Airport Marriott.

==========
Jon Bloom, KE3Z
TAPR DSP Project Report

KE3Z received one of the first set of beta test DSP boards from the hardware designer, Lyle Johnson. Procrastination set in: the board has over 2000 holes, so assembling it is a bit of work. Finally, got it assembled. The next step was to learn about how to do DSP programming. Highly recommended: the Computer Literacy Bookstores in and around San Jose. Good books for techno-weenies, including some on DSP.

Some preliminary DSP applications are already written and working. A Bell 202 (1200 bps AFSK, like on 2m packet) modem is up and working, with a driver for KA9Q NOS for packet use. A RTTY modem (2125/2295 Hz AFSK) with a RTTY driver and receive-only AMTOR driver is working. Dave Hershberger, W9GR, has written two audio-in/audio-out filter programs. One notches out tone interferers from the audio channel, and works great. The other tries to remove noise from an SSB signal, and needs more work. These filters were originally written for a TMS32010 board of his own design, and have been mechanically ported to the TMS320C20 on the TAPR DSP board (so they aren't optimized for it).

The lesson is that DSP software isn't necessarily magic anymore. It is quite possible to write working modem software, for instance, without getting heavily into sophisticated mathematics. The basic building blocks are simple, and design tools exist to handle filter

design.

Coming attractions:
     Bell 103 modem (HF packet)
     1200 baud PSK for Pacsats
     9600 baud FSK (K9NG/G3RUH/TAPR compatible)
     Spectrum display
     4800 baud PSK for Pacsat - the satellite has never been in this mode, since no user modems have ever been built.
     2400 bps Kantronics-style
     improved W9GR "de-noiser" filter
     weather fax
     slow-scan television

Some of these applications exist for other boards, and just need to be ported to the TAPR board. Others need to be written from scratch. Many of these applications will be implemented over this spring and summer. PC software to support the applications is also needed. NOS is nice for some packet applications, but other applications need other PC software.

A virtual-hardware block diagram of the RTTY demodulator is shown. It's just two bandpass filters running into detectors, followed by a comparator and lowpass filter. Standard stuff.

DSP-oriented block diagram of the RTTY demodulator. The bandpass filters are straight out of a manufacturer's application note. The coefficients for the filters are computed by a computer program, so no heavy math is needed. The filter design is an 80-tap FIR (finite impulse response) linear phase filter. The detector is just absolute value, then a peak detector followed by a decay. The comparator is just a subtraction. The lowpass filter is another cookbook design. That's it. Notice the absence of any higher math in this description. This isn't the optimum demodulator, but it's as good as most analog designs, and it works.

A similar approach was tried for the Bell 202 demodulator, but for unknown reasons it didn't work very well. A Bell 103 modem was taken from another ap note, based on a discriminator design: the audio is delayed by 90 degrees and mixed with itself, then lowpass filtered and compared to zero. The Bell 202 demodulator is just this design, tweaked up for Bell 202 tones and bit rate.

The book _Digital Signal Processing Experiments_ by Alan Kamas and Edward A. Lee contains a diskette with educational versions of Burr-Brown DSP design tools, including the tool that generates coefficients for FIR filters. The book is quite inexpensive (about $21) for a DSP tool set. It's published by Prentice-Hall; recommended.

Both DSP programmers and PC programmers are needed to work on applications for the TAPR DSP project. The PC level programmer sees an environment much like a DSRI board plugged into a PC. Contact Jon

Bloom if you're interested.

Tom Clark, W3IWI, spoke up:
The TAPR DSP project grew out of earlier development on the Dalanco-Spry Model 10 DSP board. About 30 of these boards were purchased, and probably some could be made available to new interested people. Lots of applications were written for the Dalanco-Spry board, and they're all available for the grabbing on tomcat (Tom C's AT) by anonymous FTP via Internet, or by telephone, or by floppy disk if necessary. Another application that's needed is a good adaptive HF modem (along the lines of Clover II), and HF protocols that can use them. AX.25 sucks on HF. AMTOR has problems, too. Pacsat broadcast protocols are a bit like what's needed for an HF protocol, but it needs changes for the HF environment.

Question: Who is doing satellite imaging?
Answer (W3IWI): The AEA box has it. The Dalanco-Spry board had it, and that version will be ported (or rewritten) for the TAPR DSP board. We may want to rewrite rather than porting Dalanco-Spry applications, because the subset of instructions supported by that processor was pretty brain-damaged compared to the instruction set of the TMS320C20 used on the TAPR DSP. The AEA box contains a Motorola 56001 DSP processor. Its modems are superb compared to analog modems.

Question: What sampling rate can DSPs handle?
Answer (W3IWI): The Dalanco-Spry board could do a spectral display at 50 KHz.
Answer (KE3Z): It's been suggested that we can just digitize the antenna voltage.
Answer (W3IWI): Unintentional radiation can be a problem. The DSP processors can generate a lot of crud.
Answer (KE3Z): The TAPR DSP board is pretty well decoupled.

==========
Bob Nielsen presented an award to Chuck Green, N0ADI, for his outstanding contributions to the development of packet radio through ten years of TAPR. Chuck accepted the award, but claimed that it represents the teamwork that goes on behind the scenes everywhere.

Pete Eaton held the drawing for door prizes, then the meeting broke for lunch.

==========
Mike Parker, KT7D
The Radio Workstation Concept

Block diagram: Antenna connected to analog radio, connected to a digital sampling and output box, connected to a general purpose workstation.

The problem with DSP software is that it's so difficult to write for special-purpose DSP processors. By the time you've finished writing

the software, the special-purpose DSP processor you wrote it for is obsolete. Worse, by that time your general-purpose workstation has improved in performance to the point where it outperforms the old special-purpose DSP! This whole problem can be bypassed by writing the DSP application for the general purpose workstation in the first place. Portable languages can be used, so it should be easy to take advantage of improved workstation technology as it comes along.

Block diagram of a sample application (not implemented): meteorology satellite image reception and display. The software can be written in manageable small modules, like orbit prediction or overlay generation, and the resulting modules can be patched together readily to make a complex application.

The SPARCstation currently used as the workstation costs about $10,000 after discounts. Thus the TAPR DSP project and the Radio Workstation approach address different (but overlapping) issues. The TAPR DSP is cost effective, IF you can get the software working quickly. Experimental applications written for the Radio Workstation might serve as prototypes for DSP-board applications.

The current configuration uses a DAT (digital audio tape) machine interfaced via SCSI to the SPARCstation or VAX, running Unix or VMS, with signal processing software, an interactive display layer like X, and FORTRAN with VMS extensions and C for widgets. This isn't a cheap configuration, but it's off-the-shelf. The code developed for this project is being made available free, on the condition that if you add to it, you make your results available free also.

Why should TAPR get involved in this project?
- to help promote research
- to spend time doing research, not software development
- to develop and debug applications for the TAPR DSP board
- to help develop standards for file structures, datalink structures, and so forth, before it's too late.

Question: How big is the publicly-available source code?
Answer: About 100,000 lines of code, comprising 300 processing primitives.

==========
Tom Clark, W3IWI
Various Topics

Topic #1: 900 MHz
In 1985, Motorola and NEC were engaged in a battle to dominate the market for cellular telephone base station equipment. In 1990, NEC gave up on the market, and the hardware they had managed to sell was orphaned. In 1991, the NEC hardware at cell sites in Richmond was scrapped. A total of over 100 45W radios already outfitted for 19.2 kbps data were made available surplus for $20 each. The equipment complement for a normal cell site was 16 transmitters and 16 receivers, all nicely racked up. Six cell sites plus spares were scrapped. Each cluster weighs about 800 pounds and fills a pickup

truck. The salvaged radios are all spoken for, but similar opportunities may become available in other areas.

The radios are set up for 19.2 kbps data, with a digital interface, used originally for signaling for billing purposes. They are designed for full duplex operation, and the receiver won't work without the transmitter operating. An analysis of the filters indicates that data scramblers will probably not be required. The transmitters are a very simple, conservative design. They are serviceable, understandable, and robust.

Block diagram of the receiver. A buffer amp feeds a synthesizer-driven mixer, followed by a standard IF and discriminator. A measurement of received signal strength goes to a Z80 microprocessor. The audio and demodulated data go out. The 70 MHz IF filters are from the same line as those used in the Microsat receiver. The RF filters will need to be replaced with ones that can go up to the amateur 900 MHz frequencies. High-side injection will be needed, because low-side injection puts the IF image in a crowded spot in the band. The modification involves removing a chip capacitor and trimming a microstrip. It remains to be seen whether the Z80 processor part of the board is useful. Perhaps it could be used for signal strength telemetry.

Block diagram of the transmitter. A 15.36 MHz oscillator drives a synthesizer. A power controlled amplifier chain feeds the antenna. The modulator frequency modulates the synthesizer. One bandpass filter in the RF path needs to be replaced to reach the amateur 900 MHz band.

All this cost us $20 per unit. Be jealous.

Outstanding issues and problems:

* The transmit frequency isn't easily moved. Luckily, this is a relatively simple radio so modifications are easy.

* Frequency stability. In the cell site, the radios were driven by one common master oscillator at 15.36 MHz. To use the radios individually and get 1 kHz error at 900 MHz, we need to provide an oscillator that's good to one part in 1e6. Crystal manufacturers want $80 to $90 for such an oscillator, despite the quantity price of around $7. If anybody knows a source for small quantities of 15.36 MHz oscillators, please let me know.

* Antennas and preamps. To use all 100 radios, we need to get 200 antennas and 100 preamps. They have to be cheap and easy to replicate 100 times.

* The vehicle locator service has priority over the amateur service in the 900 MHz band. The AVL (automatic vehicle locator) folks have been very aggressive about defending their allocation, even threatening civil suits against retail stores using theft alarms in the band. The North Texas Microwave Group is also looking into this problem.

* Network coordination and architecture. This is mainly a political problem. It has practical implications, like what kind of antennas are needed and where they have to be pointed. The biggest problem is how get everyone to agree on something, anything.

* Data pump. The standard NET/ROM or TheNet stack of TNC's isn't suitable. Something like the Kantronics DataEngine, PacComm's V53 board, or the Gracilis PackeTen board is needed. It has to be cheap, reliable, and robust enough to survive a mountaintop environment.

Topic #2: AO-13 orbit decay and Phase III-D

AMSAT OSCAR-13 is in a highly elliptical orbit, and its perigee height has been decreasing steadily. If this trend continues, the satellite would be lost during 1992. However, the perigee height is starting to turn up, as predicted.

A graph shows the prediction generated using the Cray computer running the NASA GEODYN theoretical model of deep space orbits, and the NORAD tracking data obtained since the prediction was run. The real data tracks the prediction pretty well. The prediction shows that AO-13 will be lost in 1996.

The effect is NOT atmospheric drag. The gravity field of the Sun and the Moon are changing the shape of the orbit, making it more narrow and moving it toward apogee. When the eccentricity reaches 0.75, the perigee will intersect the atmosphere. The inclination is also changing.

AO-13 is going to die. There's no way to save it: there's no fuel on board, and there's no way to dig a deep enough tunnel through the Earth. So, what we need is a replacement satellite.

A diagram of the Phase III-D mechanical design shows a *really* *big* satellite. It's roughly triangular, 8 feet on a side, with two solar panel "wings" with a 17-foot span. The configuration shown (one of several proposed) has antennas for bands from 10 meters to 10 GHz. The satellite will have receivers on 2 meters through 3 cm, transmitters on 10 meters through 3 cm, and a programmable IF matrix capable of selecting any desired combination of bands.

Users in urban areas are having more and more trouble installing large antennas, so the satellite will have 10 dB to 20 dB more performance on each link. The 10m downlink will be capable of several hundred watts, possibly using the long solar panel wings for an antenna. The gain antennas for 2m and 70cm consist of several elements mounted on the sides of the spacecraft, each with its own amplifier with controllable phase, giving many possible antenna patterns. The satellite will be 3-axis stabilized using momentum wheels, so the antennas will always be pointing straight down at the Earth.

This new satellite will also have an elliptical orbit. We've learned an important lesson with AO-13: elliptical orbits are chaotic. It's possible (though not easy) to predict what will happen with a well-known set of initial conditions, but it's not possible to compute a set of initial conditions that will result in a desired orbit. So, to ensure that Phase III-D will have a long life in the desired orbit, it will be equipped with a motor that can be used many times to made adjustments to the orbit. The desired orbit makes exactly 3 orbits in exactly 2 days, so the groundtrack repeats every other day, with spectacular coverage. The German AMSAT folks negotiated a launch opportunity on the first experimental flight of the Ariane 5 rocket (we can't afford a launch like this on a proven vehicle).

Topic #3: TCP/IP and Internet

All sorts of packet-related goodies are available online on the Internet on the computer ucsd.edu and tomcat.gsfc.nasa.gov. Soon a dedicated host for AMSAT mail, amsat.org, will be installed at UCSD in San Diego under the supervision of network guru Brian Kantor, WB6CYT.

Phil Karn, KA9Q, added a hack to his TCP/IP software package to permit IP packets to be encapsulated inside IP packets. This permits packets from one amateur radio network to be sent to another amateur network over the Internet, without the intervening hosts needing to know about the amateur networks. At least seven "encap" gateways have been installed for this purpose: Honolulu, Sydney, Richmond, Chicago, Las Vegas, Geneva, and Ottawa. To install such a gateway just takes someone with both radio smarts and a good Internet connection. Is this amateur radio? Well, it sure is on the ends.

The internet has proven to be a valuable resource. Encourage people to find a way to get on the Internet. The Internet powers that be have blessed this kind of operation as a legitimate use of the Internet.

Topic #4: World's Smallest NOS Box?

A HP-95LX palmtop computer was displayed running KA9Q NOS. It has both RS-232 and Infrared data interfaces.

Question: What funding is needed for Phase III-D?
Answer: The total commitment is about $3 million. The ARRL and AMSAT-NA have committed over $1 million, the rest comes from other national groups around the world.

Question: Is that realistic?
Answer: I hope so. If it isn't, and we can't get industrial sponsorships to fill the difference, the AMSAT's ability to develop bigger and better satellites is at an end. The amateur satellite program puts amateur radio in the limelight as a technical pioneer.

Question: Is there time to get the satellite built?
Answer: Yes. But commitments have to be made soon.

Question: Is there a special fund for this?
Answer: Yes, the Phase III-D Spacecraft fund.
Followup: What do I write on the check?
Answer: "AMSAT" and lots of zeroes. You can earmark any contribution for particular projects if you want.

Question: Are there plans for a digital transponder?
Answer: Yes, in every path. Imagine having T1 rates or better on some of the microwave channels.

Question: How will the satellite know which way to point?
Answer: The idea of using GPS receivers to orient the satellite is still being investigated. The satellite will be outside the GPS orbit much of the time, so we need to know the antenna patterns of the GPS satellites (which aren't advertised).

Question: What data interface do the cellular radios have?
Answer: RS-422 differential.

Question: What about duplexers for all those radios?
Answer: We may just use separate antennas. We did get some duplexers and so forth with the cell hardware.

==========
Lyle Johnson, WA7GXD, and Jack Davis, WA4EJR
Hardware Projects: Trakbox, Deviation Meter, Etc.

The Trakbox is a good example of a project that involved extensive international cooperation. Jack Davis, WA4EJR, was involved from the beginning, and TAPR got involved recently.

The project began in Sweden with amateurs using building block circuit boards from Micromint. These boards were based on the 8051 family of microcontrollers, and were originally published as projects in Byte magazine. Amateurs in Japan decided to make a special-purpose board to cut costs. Schematics and firmware were exchanged between amateurs in various countries using UoSAT OSCAR-14. The resulting board is now available as a kit from TAPR.

The board is a standalone rotor controller. This solves the problem of pointing the antennas at satellites, especially fast-moving satellites in low earth orbit, while also trying to do other tasks. The Kansas City Tracker has been available for a while now, but it requires an IBM PC, and takes up a slot, and requires the PC to be on during the pass. The Trakbox eliminates these limitations.

The Trakbox is based on an 8051 microcontroller with RAM and program memory, a realtime clock, and a LCD display. The user provides Keplerian elements through an RS-232 serial port, and then controls the operation of the Trakbox using the LCD display and front panel

controls. The box interfaces directly to Kenpro rotators, and can be interfaced to other brands of rotator. The Trakbox can also control the receive frequency to compensate for Doppler shift, using either the computer interface or the up/down step buttons on Icom, Kenwood, or Yaesu radios.

A portion of the price of each kit sold is donated to the Phase III-D project. The documentation shipping now is preliminary. The assembly instructions are complete, but the operating manual is a bit primitive. Since the Trakbox is easy to use, this isn't too bad. The manual will be updated, and software development continues to improve speed and add features. Firmware updates will be free, or TAPR can reprogram the EPROM for the usual nominal fee.

A bare board identical to the one used in the RUDAK digital transponder was passed around.

A piece of unusual looking hardware mounted on a big round aluminum plate was displayed, and the audience was asked to guess what it was. It was a TAPR development project around 1985 that didn't get a lot of publicity. It was a data collection and experiment control system for a payload built by a group of high school students in Dallas. It was flown in a GAS (Get-Away Special) Can on the space shuttle Discovery in 1985. Unfortunately, delays before and after launch proved too much for the batteries, and all the data was lost before it could be downloaded from the experiment.

The prototype of the TAPR Deviation Meter was passed around. A block diagram shows a 2 meter receiver with a 10.7 MHz IF followed by a second IF, followed by peak detectors feeding an analog-to-digital converter. The A/D converter is read by a tiny microcontroller, which also runs an LED display and an RS-232 port, and can output the measured deviation to either. The frequency synthesizer can tune any frequency in the 2m band. A calibration oscillator is on-board in the 10.7 MHz IF to permit the board to calibrate itself. Everything on the prototype is working, except a single buffer amplifier in the 135 MHz local oscillator. The prototype was used to test the 9600 baud modem kit.

Once the buffer amplifier problem is fixed, we can "turn the crank" and make a batch of the deviation meters available. TAPR has receive mail claiming that it's impossible to make a product like this for less than $100, but TAPR can!

Question: Does the TrakBox emit any RF at 2m?
Answer: Maybe a little, but your outside antennas probably won't hear it.

Question: Does the LCD on the Trakbox show the time to the next pass?
Answer: No, it shows the present time. It does have a (slow) future prediction mode via the serial port.

Question: How was this nice circuit board created?

Answer: Chuck Green, N0ADI, did the layout using ProCAD. TAPR uses
circuit board fab houses in Tucson and in Orange County, CA.

Question: How fast can a new board be manufactured?
Answer: That depends on the cost. For a standard TAPR production run
of 20 to 100 multilayer boards, it costs about $800 to $1000 per lot.

[Part 2 of 2]

==========
Mark Oppenheim, KD6KQ
VITA - Volunteers in Technical Assistance

VITA was founded 30 years ago by a group of scientists in Arlington,
VA, to service as an information conduit to assist developing
countries with their technical infrastructure. A staff of about 75
people presently answers requests free of charge. Many VITA
volunteers are also registered with their areas of expertise,
including N6ARE, WA7GXD, NK6K, HB9AQZ. In times of disaster, like
the earthquake in Armenia, VITA coordinates donors, using their large
communications setup at the office. HF packet and Pacsat operation
are among the supported modes.

Since 1981, VITA has been working on using packet in developing
countries. Local telephone systems are often like two tin cans with
a bad string between them, and are unusable for data. Thanks to the
amateur radio work in reducing the cost of packet radio, packet (on
non-amateur frequencies) can be used to bypass the phone network. VHF
packet was used to coordinate aid during the Ethiopian famine.
Demonstration networks have been operated in Somalia, Lesuthu, and
Mozambique. An HF network is operating in Sudan.

VITA first worked with packet satellites using UoSAT-2. The software
was too manual, and the satellite was so deaf that a large water

buffalo would be needed to power the uplink transmitter. UoSAT OSCAR-14 was launched with partial VITA funding. Software delays and complexity were problems. VITA hired a programmer to develop simple-to-use groundstation software for their application, and they use Quiktrak for satellite tracking. The next step is to launch a dedicated satellite, VITAsat. There may be room for some amateur radio payload as well. A network with up to 500 groundstations in planned.

UoSAT OSCAR-22 was originally to be mainly used by VITA and Satellife, a group with similar purposes but oriented toward medical technology. The power amplifier on UO-22's non-amateur downlink failed, so satellite allocations between UO-14 and UO-22 were reshuffled. UO-22 is now 100% amateur, and UO-14 is 100% VITA and Satellife.

Numerous travelogue slides showed people, equipment, and camels.

Question: Are the locals generally able to operate the equipment?
Answer: Sometimes. Luckily, the equipment has been quite reliable so far, so no maintenance has been required.

Question: How is all this funded?
Answer: The equipment is purchased by the "customer". Some money is also available through grants. VITA does not charge for access to the satellite.

Question: Do you have difficulties with importing technology?
Answer: Sometimes.

==========
Masa Sawada, JF2GPF
TASCO

TASCO was founded by JA2AQO, the current president, in 1979. TASCO began by selling weather facsimile terminals and RTTY decoder. In the mid 1980's, TASCO began selling amateur packet radio into the Japanese market under license from TAPR. They are constantly working on new technologies, and all technical staffers are amateur radio operators. Congratulations to TAPR on its 10th Anniversary.

==========
Bill Henry
Clover II

Several articles about Clover II have appeared, and more are on the way. The last two Proceedings of the ARRL Computer Networking Conference had papers by Ray Petit, W7GHM: 1990 about Clover I, and 1991 about Clover II. A July 1990 QEX article featured Clover I. Several articles have appeared in The RTTY Journal. A series in Communications Quarterly and another in QST will lead up to Clover II.

Clover is still experimental - it isn't a product yet. It was

invented by Ray Petit a year and a half ago. It was an outgrowth of earlier coherent CW experiments, which used phase coherent detection with very stable oscillators (a few parts in 1e8) and detection bandwidths as narrow as 0.01 Hz. Such equipment can demodulate signals that can't be heard by ear. The early Clover articles in QEX caught Bill Henry's attention, and they teamed up to make a product.

The particulars of Clover II are derived to counteract what the ionosphere does to corrupt a data signal. One basic limitation of HF propagation is signal to noise ratio. Earlier RTTY designs have concentrated mainly on this problem, by optimizing bandwidth and using adaptive AGC or good wideband limiters.

Another difficulty with HF is the existence of multiple propagation paths of different lengths. The differential delays result in selective fading. On voice, this is merely annoying, but on data it is a disaster. Out of phase signals cancel. On FSK, the mark and space tones fade separately (a good RTTY demodulator handles this). What's worse, the bits can get smeared out in time by up to several milliseconds. This is what's wrong with HF packet: 300 baud is too fast. Most experts agree that about 100 to 150 baud is the limit for usual HF conditions. Now and then, conditions are "like a wire" and there's no problem with multipath. Such conditions are quite rare - and that's the only time HF packet works! AMTOR users can tell you that sometimes even 100 baud is too fast.

Clover copes with this problem by using a signaling rate of 31.25 baud. That's pretty slow. To get a reasonable data rate with such a slow baud rate, Clover packs more than one bit in each pulse. Clover uses PSK with two, four, eight, or sixteen distinct phases to encode 1 to 4 bits of information on each pulse. Clover then uses this scheme in a time-staggered scheme with four different carrier tones, resulting in a total bandwidth of 500 Hz, which is a good match for available CW filters. When conditions are good, Clover goes further by adding two-level or four-level amplitude modulation, for even higher maximum data rate, without changing the basic modulation rate of 31.25 Hz.

PSK modulation can be a problem, because its bandwidth is usually very wide. Clover avoids this problem by pulsing the four tones on and off with a very carefully-chosen pulse shape called a Dolph-Chebychev function, and performing the phase changes while the pulse is completely off. The result is that the energy of a four-tone Clover signal is very tightly contained within 500 Hz. With a 60 dB limit imposed by the quantization in the digital-to-analog converter, the Clover transmitter's sidebands are down 50 dB outside the 500 Hz. Two Clover signals can be spaced just 500 Hz apart (edge to edge) with 55 dB rejection.

Graphs of the spectra of Clover, HF packet, and AMTOR show that Clover is a *lot* tighter. The standard rule of thumb says that two AMTOR signals need to be 1 kHz apart, and HF packet signals need 2 kHz. The spectra clearly show why: poor sideband suppression. Clover is

effectively much narrower. Not only that, but Clover is faster on real channels. Ignoring the question of 5-bit characters versus 8-bit characters for now, both HF packet and AMTOR have typical real-world throughputs of 5 to 7 characters per second. In tests on the air, Clover typically achieves 50 to 80 characters per second.

Another weakness of HF packet is the error control scheme used. With packet, a long frame of up to 30 seconds is sent, and every single bit in the frame must be received correctly, or it is discarded. Because of this limitation, HF packet operators must run small packet sizes of 32 or 64 characters. This makes the packets short enough to get through (sometimes), but increases the cost of packet headers and waiting between packets. That's how a 300 baud mode gets down to 5 or 7 characters per second. Clover uses a forward error correction technique called Reed-Solomon coding. This technique transmits a few extra bits, and uses the carefully encoded redundancy in the data to correct the received data without requiring a retransmission. For example, a R-S code that is 60% efficient can correct 25 errors in a block of 255 bits. Because the R-S code can correct some errors in each frame, Clover is able to send longer frames without losing too many to errors. Of course, sometimes long frames just don't get through due to fading conditions; in this case Clover can fall back to shorter frame lengths.

As W3IWI has pointed out, HF calls for adaptive modems. Clover is about as adaptive as you could want. There are 8 basic modulation modes to choose from (different numbers of phases and amplitudes for each pulse), times 4 frame lengths, plus 4 different Reed-Solomon codes of varying efficiency and error-correction capability, for a total of 128 different modulations. Every one of those 128 modulations has the same 500 Hz spectrum. The Clover modem also controls the transmitter output power. Obviously, mode and power selection has to be automatic!

The receiver measures the phase, time, and frequency dispersion of the received signal and picks a mode. It sends an order to the transmitter specifying which mode it wants. It can change modes within a second if a short block length is in use. The modes range from 2.3 characters per second to 94 characters per second, theoretical throughput. The field tests have shown a typical range of from 28 to 62 characters per second. Note that the receiver doesn't just move up to higher speeds when conditions are good and down to lower speeds when conditions are bad. It can figure out by listening to the signal what exactly is wrong with the signal and request the mode that best fits current conditions. For instance, if it notes that phase dispersion is bad, it can fall back to a mode with fewer phases. If it notes that it has excess signal to noise ratio, it can command the other station to reduce power. (This can lead to the rather disconcerting situation where the transmitter's meters are not moving, and the receiver's audio has no audible tones, yet characters are still moving through the link!)

The implementation is DSP, DSP, DSP. The input jack goes to a

transformer and a 16-bit A/D converter, and the rest is digital. The A/D converter is a 16-bit sigma-delta oversampling converter like the ones used in digital audio applications. It doesn't need any anti-aliasing filter, and it has lots of dynamic range. It currently costs $20, but should get cheaper. The transmit audio is also a 16 bit oversampling audio component, followed by a simple filter to get rid of the residual 100th harmonic. A Motorola 56001 DSP processor supplies the signal processing horsepower. The original design used a 6809 microprocessor for general control functions, but it ran out of gas. The current prototype now uses a 68EC000 processor at about 30% utilization. The board contains only bootstrap ROMs; the Clover code is downloaded from the PC.

Vic Poor is writing a Clover driver for Aplink. The Clover board has FIFOs on the input and output to relax realtime requirements, which is expected to be especially helpful for PCs running Windows.

Two working prototype Clover boards will be displayed at Dayton. On initial release, the card will do only Clover. If anybody wants to write other modems for the board, the door is open. A more pressing need is a new protocol suitable for HF work. Anybody who writes network code and wants to write drivers for Clover, we can set you up with hardware and provide assistance. The command protocol will be defined by next week.

Question: Isn't frequency accuracy and stability still a problem?
Answer: With the faster CPU, the DSP no longer has to do Reed-Solomon decoding. That means it has enough spare horsepower to do more frequency acquisition and tracking. Clover can now handle frequency errors of up to 40 Hz, which is similar to the guidelines for HF packet.

Question: What about intermodulation distortion in the transmitter?
Answer: Measurements of high-end rigs show very good IMD. A worse problem is broadband noise, which is about 40 dB down. That doesn't seem to hurt, either.

Question: What's the price?
Answer: The introductory price will be $995. This is a lower price than announced before, because it's now a PC plugin board rather than a box. The parts are expensive, even the socket for the DSP chip is expensive. The board is 4 layer.

Question: What is the peak to average power ratio?
Answer: 3 dB for all modes.

Question: Is it legal?
Answer: Yes. It's not multiplex because the four tones are sent serially rather than in parallel. The emission designator is 500HJ2DEN. The Chief Engineer and Chief of Enforcement of the FCC have both agreed verbally that this modulation is legal.

==========

Gwynn Ready, W1BEL
PacComm Topics

PacComm is currently working on a custom packet protocol for commercial HF applications. It runs long frames, but avoids the problems of AX.25. It uses a "superframe" containing multiple copies of the address and multiple checksums. It uses a selective nack protocol so receiving stations need only nack missing pieces of each superframe.

Topic #1: PACTOR

PacComm is exclusive licensee of PACTOR in the USA (for a few years), and point of contact for PACTOR. PACTOR is an ARQ protocol more like AMTOR than like packet. The PACTOR controller will also do RTTY and AMTOR, and automatically falls back when talking to a non-PACTOR station. It stores partially-received frames in memory and tries to combine them to get one good frame. This technique is called "memory ARQ". The box is binary compatible with the original German version. Hardware is expensive to build in Germany, so PacComm is building PACTOR controllers in the USA. An Aplink driver is on the way.

Topic #2: Baycom

Baycom (pronounced Bye-Comm) is a packet program for the IBM PC like DIGICOM>64 for the Commodore 64, from the same German team. They have now formed a company, and have licensed PacComm (non-exclusively) to distribute in the USA (and to work to enforce their copyright in the USA). Two modems are to be available: a serial port modem based on the TCM3105, powered from the port and physically inside the port connector, and a version based on the AM7911 in a box with HF capability. The PC-100 series will also be upgraded for 4-port Baycom compatibility, 300/1200/9600 baud, with modem disconnect and mounts for Tekk radios. These products may be available by Dayton.

Topic #3: NB-96 Product Line

The NB-96 line is a licensed version of the G3RUH 9600 baud modem. The weaknesses of the original design for full duplex use have been fixed. The board has more groundplane and more bypass capacitors. Receive and transmit circuits have been separated. The components that determine the modem speed are now on a header, so you can pick whatever baud rate your radios can support.

The EM-NB96 external version of the NB-96 has been out of production, but now it's back in production. It is intended as a stopgap until DSP modems become available and affordable, or for the operator who already has most of the modems he expects to need and just needs to add 9600 baud. It is versatile: the user can switch to internal or external clocks, route the push-to-talk, and choose the TNC's built-in 1200 baud modem or either of two external modems. An LED

indicates when you have the settings wrong -- this tends to cut down on user support calls.

An integrated packet radio system containing the modem, the TNC, and the RF circuitry all in a single box is in prototyping now. The original plan was to mount the radio on the circuit board, but interference prevented that from working. So the radio is now mounted in the chassis, with the side benefit that there is now room for two separate radios.

Topic #4: TNC Upgrades

When running 9600 baud continuously (like on a satellite downlink), the TNC needs to support a terminal baud rate greater than 9600. The TINY-2 can run 19200 baud continuous, and it's the only TNC that can do that out of the box. TINY-2's are now shipping with 10 MHz Z80 microprocessors, which enables them to run at 38400 baud on the terminal port.

A high speed data controller based on the V53 processor with an 85230 serial chip and a fancy power supply on-board is being marketed mainly to commercial customers -- it's too expensive for the ham market. A PacComm HandiPacket is in use on the Russian space station MIR, which has generated lots of publicity. They are also used in the ground terminals used with the DARPA Microsat project (not to be confused with AMSAT's more sophisticated Microsats).

A 1200 baud modem about the size of your thumb is shipping 100 to 200 units a month to commercial customers, who are now asking for a tiny 9600 baud modem.

==========

Pete Eaton made a few announcements, then the meeting broke for the day. It reconvened at 9:00 AM on Sunday.

==========
Fred Treasure, KE5CI
A Packet-Controlled Telescope

In 1987, Bill Neely, KC5ZG, purchased a large telescope mirror, with plans to automate the pointing arrangements. Since then, the system has grown a little ...

Block diagram of the observatory system. A control computer in town communicates via a 9600 baud packet link, through a dedicated repeater site, through another 9600 baud packet link to the communication and storage computer in the "warm room" at the observatory ranch. That computer talks via a 2.5 Mbps ARCnet link to the control computer, which in turn talks via 1200 baud asynchronous RS-232 to the computer that controls the pointing. Whew!

The NF/ Observatory tracks asteroids and other objects of interest,

capturing images using a CCD camera on the 17.5 inch telescope. Congress has generated an initiative to shoot down an asteroid rather than let it collide with Earth. This observatory has volunteered to gather data on near-earth orbit asteroids in support of this project.

The name "NF/" stands for "Neely Fraska Bar", the name of the ranch on which the observatory is located. The ranch is about 25 miles from Silver City, NM, at an elevation of 5800 feet. The packet repeater is on Baldec Peak.

The 9600 baud links run on Mocom 70 radios with Texnet 9600 baud modem. The Texnet network control processor (NCP) has been modified to run KISS with 2048-byte packets for TCP/IP. The Silver City to Baldec link is on 442.5 MHz, line of sight, with 4-element yagis on each end of the link. The link from Baldec to the ranch is on 447.5 MHz. There's no line of sight path on this link, so there's a 16-element yagi on the tower on the mountain and an 11 foot dish with 21 or 22 dB gain at the ranch.

The system can transfer a 512x512 pixel image with 4 bits per pixel (about a half megabyte of data) in about 10 minutes. More typically, it transfers a 320x200x8 VGA image in about 1 minute. This kind of image is suitable for previewing the results. The full results are stored at the site, and transported using magnetic tape.

The system includes three 80286-based computers and one XT-class machine. A request for a series of images is entered into the computer in Silver City. It goes through the links to the ranch house, which turns on the telescope and the rest of the computers. Lots of computers made more sense for this job than a larger multitasking machine, because realtime control was needed.

The XT tracking computer can automatically calibrate the positioners, starting from the weatherproof "parked" position. Fixed sensors on the telescope mount can get it pointed close enough to find a calibration star. Then the telescope automatically locks onto the bright object near the center of the field. Telemetry about the weather and control voltages go back over the link to the in-town computer.

The second computer provides the timing signals to the CCD sensor and stores the resulting image on its hard disk. Best performance from the CCD is obtained by tuning the precise voltages applied to it. This telescope achieves about 25 electrons of noise. Compare this to the best NASA sensors at 3 electrons of noise; pretty good for an amateur effort. About 60 images are stored on the hard disk drive, then they are dumped in a batch to a magnetic tape drive attached to the computer in the ranch house. About once a week, the data is fetched by car. Once the tape is verified, the hard disk is erased. The telescope dome automatically closes, the telescope parks, and powers off. The entire process is completely automated; no human intervention is not required. The telescope system has failsafe interlocks: if moisture is detected, or if the link fails, the system

automatically parks and shuts down.

The system cost about $5000, plus about 5000 man-hours, mostly spent on the programming. Bill Neely, KC6ZG, and Lori Neely did most of the programming; Fred Treasure and Barbara Treasure, N5HJN, provided most of the hardware. K2GNR and the Jet Propulsion Laboratory provided the camera chips. NASA provided the magnetic tape recorder.

Question: Are there other sites sharing the data format?
Answer: The data is recorded in a standard format. However, there is only one other telescope that's as completely radio-controlled as this one: the Hubble Space Telescope! The team gets invited to professional astronomy events. The professionals couldn't do a project like this for $100,000.

Question: Is compression used on the links?
Answer: We tried LZW compression, and it gave only about 25% compression on this type of data. That's not worth the extra trouble, since there is plenty of capacity on the links.

Question: What polarization are the links using? My experience is that vertical doesn't work in the mountains.
Answer: We chose horizontal, more or less by guess. It works.

Question: What weather sensors are installed?
Answer: Anemometer, a cloud sensor that works by sensing the temperature of the sky versus the ground, a moisture-detection grid, and thermistors to measure temperature.

Question: What kind of cooling is used?
Answer: A three-state thermoelectric cooler and liquid cooling.

Question: Tracking rates?
Answer: Completely variable.

==========
Lyle Johnson, WA7GXD
Bit Regenerative Full-Duplex Repeaters

Why full duplex? It helps to cure the problems caused by hidden terminals. The coverage area can be controlled using antenna patterns, or to a lesser extent by varying the repeater transmit power. The Tucson LAN has a large radius of 150 miles, and the full duplex repeater helps throughput. It helps stations at the edges of the LAN to communicate.

With bit regeneration, the repeater demodulates incoming signals and remodulates them before retransmission. This allows the repeater to control the deviation of the transmitted signal. By using a bit regenerator with some FIFO buffering (like the one on the new TAPR 9600 baud modem) to remove clock jitter and clock rate errors, the transmitted signal can be perfect. Most TNCs are crystal controlled, so not much buffer is needed.

The bit regen repeater has some social impact as well: the repeater operators get some control over the type of traffic that is transmitted on the channel. A station that habitually hogs the channel can be throttled by the node TNC by simply generating a glitch in the middle of each packet they transmit. Technical compliance can also be ensured.

Question: What are the pros and cons of checking the CRC before regenerating the bits?
Answer: If the TNC waits for the entire frame to arrive so the CRC can be checked before transmitting, it ends up acting just like a digipeater. That cuts the throughput by a factor of at least two. The "lid filter" function mentioned above doesn't require checking the CRC: if the node TNC glitches the wrong frame because of bit errors in the received frame, the frame wouldn't have been accepted at the receiving end anyway. The other aspect is the need for the output to come on the air quickly as soon as a signal is detected on the input. This is required so other users won't start transmitting and colliding with the first input. With the FIFO, the repeater only sends a few bits of garbage data as a busy tone before the real bits start to come out.

Question: Are the bit regen kits available now?
Answer: Yes. It's just a couple of parts. The bit regenerator could be used on a 1200 baud regenerative repeater, too.

With a central repeater, the users can use directional antennas and get better performance. The single-point reliability is about the same as a single central digipeater. The digipeater at a good site probably needs cavities anyway, so the additional cost of going full duplex is minimal.

==========
Mike Curtis, WD6EHR
Experiences with 9600 Baud

Working with many other contributors, Mike has created a beginner's handbook for 9600 baud operation. 9600 isn't as hard as people think it is. The only big problem is getting hooked up to the radio. On transmit, the radio needs fairly linear response from 100 Hz to 5 kHz, low phase distortion, and a true FM modulator. On receive, it needs good linearity and [I missed something here -Ed.].

There are a few radios capable of doing 9600 baud out of the box. The Tekk KS900L, the D4-10, and the Ramsey kits are all good. The Kantronics DVR2-2 works but isn't recommended where other strong signals are a problem. Multimode radios are generally good prospects for conversion, because they use a separate circuit for FM.

Question: What about removing extra filtering from the discriminator?
Answer: Whatever works.

Question: What test bench setup do you use for bit error rate measurements?
Answer: The G3RUH modem has a bit error detector, which generates a click for each error. Just hook up an audio amplifier and tune for minimum clicking.

Question: What parameters do you recommend for 9600 baud links?
Answer: TXDELAY as low as 3 usually works, but 6 to 10 is better. TXTAIL about 2. FRACK (the T1 timer) at 4 or 5. These parameters should be slightly more aggressive than at 1200 baud.

Question: Can 9600 be used co-channel with 1200?
Answer: Yes. In fact, we have a repeater that is dual mode 9600/1200. It seems to work, though there isn't much 9600 activity.

Question: Is 9600 used on 2m in Los Angeles?
Answer: Yes, on 2m and on 70cm.

Question: What about the Motorola Mostar 800 MHz radio?
Answer: Never heard of it.

Question: Thanks for writing the beginner's notes!
Answer: It was fun, and I had lots of help. I hope 9600 baud will take over as people try it and find it so much better that they want to abandon 1200 baud.

==========
[sorry, I didn't catch this ad-hoc speaker's name or call. -Ed.]
Experience with Mitrek Radios at 9600

We obtained some surplus Mitreks. A technician from Motorola didn't think they'd work on 9600. They do, with both the G3RUH modem and the K9NG modem. We intended to support an application for appliance operators, so we wrote a paper that describes the necessary modifications in detail. The Mitrek is fairly easy to modify. Several people have successfully followed the paper.

It's important to use shielded wire like RG-174. The original instructions called for running the wires through a hole in the case, but we found it possible to run the wires through the existing I/O connector, which makes the modified radio much more serviceable. About 10 are in use, with paths ranging from a few miles to 40 miles, vertical and horizontal antennas. When two of the radios are stacked on top of each other, some IF crosstalk causes interference between the two radios.

It's important to get 15 to 20 dB margin on the links. We did bit error rate tests, even though that isn't necessarily the best indicator. We use Comet and Diamond dualband antennas for back-to-back VHF/UHF nodes. Horizontal polarization with beam antennas seems to work better.

The biggest problem with the Mitrek is bandwidth. We replace the

4-pole filter in the front end with a wire, which is a little touchy at 10.7 MHz. We have avoided preamps because of problems with turnaround time. We run TXDELAY of 3 to 5. We've tried TCP/IP, but we usually run NET/ROM. We have a Gracilis packet switch, but it's not fully installed and working.

Question: Can you really run TXDELAY at 3 to 5 with K9NG modems?
Answer: Yes, even with the Mitrek's antenna relay.

Question: Did you modify the DCD circuit in the K9NG modem?
Answer: No.

Question: Did you make any modifications to the K9NG modem at all?
Answer: Some have done some work on the filters and DCD.

Question: Did you notice any performance loss when the front end filter was removed from the Mitrek?
Answer: No. We have three sites that are heavily infested with other transmitters, and haven't had any real problems.

Question: How many hops work in the network?
Answer: 3, 4, 5. The link to Chicago works, even though it's not 9600 all the way.

Question: How much difference did the custom EPROM in the G3RUH modem make?
Answer: We didn't make one. The default modem is good enough.

Question: Do the Mitreks also have a low IF?
Answer: No.

==========
Eric Gustafson, N7CL
More Experiences with 9600 Baud

The local oscillator the Mitrek generates about 1.5 watts of power, which is applied to the mixer. If you follow the Motorola instructions for tuning the front end filters, you get a strong LO signal everywhere, especially on the feedlines. This signal will leak into any other Mitrek, in both directions. We had this problem in a commercial installation in a mine in Nevada, resulting in crosstalk between vehicles when they were close together. We were able to realign the front end filters, and the extra attenuation helps substantially.

We use Tekk radios for 1200 bps telemetry. Their front ends can't take other strong signals. We have found them reasonably useable; others have had more luck.

Out of 10 radios, one was 15 kHz off frequency -- with 15 kHz bandwidth filters! Filters were misaligned, resulting in over 20 dB of loss. The Tekk radios perform very poorly under thermal cycling.

The transmitters perform pretty well, probably because they have to pass FCC tests, but the receivers don't. We went to crystal manufacturer Hy-Q, sort of a Filters-R-Us house. They provided filters and crystals that cured the problems with the Tekk filters and crystals, including frequency jumps and frequency errors. So now we order the Tekk radios without quartz, and get a cheaper price.

For many other radios, we found the filters weren't really quite wide enough for 9600. For a given radio, you can find an optimum FSK shift but low signal to noise ratios. Often, you have a choice between high error rate with the best S/N performance or low error rates but poor S/N performance.

Murata-Erie is now making 450 kHz ceramic filters specifically designed for data transmission, in the standard package. Two bandwidths are available, about right for 9600 and 19200 baud respectively. So now the 1st IF in many radios can be opened up by just replacing the filter with the right bandwidth unit. The resulting eye patterns look just like the transmitted signal.

Question: What's a Tekk radio?
Answer: A very small crystal-controlled transceiver that's both cheap and inexpensive. They are available for amateur frequencies as well as the commercial units we use. The transmitter tuning is very broad. Unfortunately, so is the receiver tuning.

Question: What application did Tekk originally intend for these radios?
Answer: Not sure. They are advertised for telemetry applications.

Question: Do you know of a source for manuals for a 2m Mitrek radio?
Answer: If all Mitrek manuals are the same, I have one.

Question: There is a radio by Maxim (sp?) that's similar to the Tekk. And the WA4ONG commercial product uses a Motorola Radius board set. Do you have any experience with these?
Answer: We tried the Radius, and it worked well except for the Motorola local oscillator problem. It uses a MMIC mixer with no RF stage, with the result that every harmonic of the LO out to at least 2 GHz is coming out strong. They also have a spurious response 900 kHz away from the primary response (on 8 out of 8 units).

Question: Maxars?
Answer: Not tried. We have used Maxtors successfully.

Question: Kantronics D4-10?
Answer: Not tried. The Kantronics 2m version is just wretched.

Question: What is the part number of the filter you use in the Tekk radio?
Answer: Custom part number Hy-Q QMF21MB30 roofing filter. This mod requires other component changes too. The 450 filter is SFG or SFH line. The SFH450F works at 19200 or 9600 without compensation.

Question: What bandwidth?
Answer: +/- 12 kHz, which is a bit wide for 9600, but that allows for some frequency error.

Question: So you would need a channel wider than 25 kHz?
Answer: It wouldn't interfere with, but might get some interference from, adjacent channels at 25 kHz. With the G filter, you get +/- 9 kHz, which is about right for 9600. The skirts are a bit high, but that's how they get flat group delay for data.

Question: What's a source for Murata filters is small quantities?
Answer: Maybe TAPR should provide this service.

Question: If we use a 455 kHz model instead of a 450 kHz model, it would work in other radios than the Tekk.
Answer: So would the 450 kHz model, but it would be more painful.

Question: Was the 2nd LO frequency changed because of stability problems?
Answer: The stock crystals were just on the wrong frequency.

Question: How much power does the Tekk radio generate?
Answer: Just under 2 watts.

Question: What quantity do you order to get prices of $40 to $50 each?
Answer: 8's.

Question: Any experience with Repco or Ramsey radios?
Answer: Not with Repco. With Ramsey, my only experience is with their test equipment, which was junk.
WA7GXD: Built a Ramsey kit. The Ramsey people were cooperative about filling shortages in the received kit. Got it working for about an hour, and then it died. Haven't had a chance to work on it since.
KE3Z: Has a Ramsey radio working the ARRL Lab. The coil in the transmitter was way off, but could be tweaked. The spectral purity didn't meet the FCC requirements; it wasn't even close. Ramsey has said there is a new model coming out, and not to bother publishing a review of the current model. A user could provide postfiltering to meet the rules. The receive side wasn't great either.
N7CL: I prefer receivers that have a double-balanced mixer in the front end.
Somebody: I just built a new 220 MHz Ramsey kit, and it's hot. I have it transmitting on 9600, still working on receive.
WA7GXD: Most radios work fine on frequency -- the question is how well they work where they aren't supposed to work.

Question: What about the Alinco data radio?
W1BEL: It doesn't pass direct FM signal without modification.
W3IWI: I've heard that the only difference is the front panel and the fact that it doesn't come with a microphone.
Somebody: The manual on my Alinco is the worst I've seen.
N7CL: The manual always comes last.

==========

Pete Eaton said thanks to everybody who came. If you're going to be
at Dayton, stop by the booth and say hi.

He then closed the TAPR annual meeting at 10:40 AM.

  Subject:

  Software that has BBS functionality that runs on SCO XENIX

  Discussion:

  Are there any hams out there who know of ham packet BBS software that
runs on top of a SCO XENIX platform. I want to put a BBS on the air and
am running SCO. I think the operating system itself is very BBSish,
however, to forward and receive mail via IP routing is another story.

  Thank you...

[Soapbox on]

Unfortuantely, I'm afraid that "others making a profit from their efforts" is
largely their fault. They waited far too long to "go commercial". They've
been approached by several companies who wanted to market their hardware and
software and these companies were turned away (so I've heard).

When you label something as freely distributable, you are giving it away.
To expect any compensation is absurd. I've gotten less than $100 in
shareware-type donations for my Poor Man's Packet program and I'm surprised
I've gotten this much.

I'm not discounting the work of the Baycom team. They've put a lot of
effort into Baycom and it is a wonderful program. However, a little more
business sense on their part might have made their lives happier. I hope
their deal with PacComm works out for them.

I was talking to a ham acquaintance of mine, VE3FZK (Andy), the other
day, and he mentioned that his radio experimenter's club had a talk on
Packtor (sp?) the other evening. He described it as a hybrid between
Amtor and Packet. Apparently, a group in Germany developed it and

even sells a box that does Packtor, baudot, amtor, and rtty, but NOT Packet.

The Packtor mode gives pretty good throughput on the hf bands, and he
was interested in getting some folks working with it. One of the
members of his club was working on translation of some german language
articles on the subject. His goal is to make some boxes here for just
the Packtor mode, since we should be able to come up with the talent
and materials here in Silicon valley. (Please, no flames.)

Are there any other net readers working on Packtor that would like to
coordinate with a group out here in the San Francisco area? Let me
know. If anyone has information on this mode of operation, maybe you
have some articles, or have a working system, please drop us a line.

I just signed on to the list yesterday (4-18-92) and had your
mail this morning.

I am working on my code to get my tech and novice lic. in June.

I understand that with packet one can move files and information
around between computers similar to a modem and phone line.
There seems to be a lot more to it than that. Is there a FAQ
that I could pick up that might give me some of the basics?

Thanks

Hello..
I just downloaded the Baycom software and I was wondering,
How do you hook a modem up to your radio? The docs don't really go into the
hardware all that much, but it seems like you can use just a standard old
modem.. is that true? this seems different from PMP. Can someone clarify
this for me?

Thanks

In general, telephone modems won't work for 1200 baud packet (the exception
is old Bell 202 modems).

Baycom uses a small external modem that is very similar to PMP's modem: it
has some additional hardware for RS-232 level conversion. Look in QST, 73,
etc. for companies selling Baycom-compatible modems (kits and assembled).

If you can find an amp to go behind the D4-10 that won't screw up the
turnaround time, let me know. I'll buy a couple myself.

That's a real problem... when you have a system that can turn around in
6 or 7ms, adding the several hundred milliseconds that many RF-sensed
amps need to switch is a real downer.

With the original exponential backoff in KA9Q, the problem was that
TCP/IP would *lose* the channel if any ordinary AX25 user came up.
If you had a couple of chatters and a BBS going, KA9Q would back off
to infinity. Now with settable backoff, TCP can hold it's own with
other channel users. It's now up to the user to make it channel
friendly or not. With reasonable parameters, it coexists nicely
with other users.

New version of the packet BBS software by F6FBB is now available with
anonymous FTP from

tomcat.gsfc.nasa.gov (USA) in directory bbs/f6fbb or
nic.funet.fi (Finland, Europe) in directory pub/ham/packet/bbs/f6fbb.

Key features of this software are:

- The usage of this software is very close to the one made by WA7MBL, whose commands have been kept. It has also a set of specific and original supplementary commands.

- Works on any 100 % compatible XT or AT PC fitted with a hard disk and

640 k RAM, monochrome CGA or EGA VDU, 1 up to 8 serial ports. This software allows user-customized colours but works also without any modification on a monochrome adapter.

- Can take advantage of extended or expanded memory installed in the system

- Multiconnections: up to 50 simultaneous channels on 8 TNC (4 or 8 channels per TNC depending on the software used).

- Multiplexing: this software supports usage of an external MUX (schematics included in the distribution disk), supports also extension boards in the case of a hardware configuration having more than 2 ports. The MUX connects 4 TNC on 1 serial port, either com1 or com2. Printed board will be available from the ATEPRA association, (ATEPRA, 23 rue de Provins, 77520 MONS EN MONTOIS - FRANCE).

- Operates:
- with any TNC2 or clone fitted with the special 27256 eprom containing the WA8DED firmware, or TF4/TF8, with a Z80 clock of 2.5 or, better, 4.9 MHz. -
- with a PK232 in Host-Mode
- with a G8BPQ node.
- With a KAM hostmode (I seem to have still some problems).

- Standard BBS: it is a BBS identical to the WA7MBL or W0RLI. It has also server functions (computation of satellite orbits, callbook, and operator customizable chapters, gateway to an other channel, the users being able to chat together in real time on the same or different channels, etc...).

- Forwarding: with the other BBS WA7MBL type or compatible, BIDS management (up to 2000 of them, or more depending on a parameter, are saved in a separate file), a BID is automatically generated should the user doesnt provide if. Private message works with the management of MID. The messages are suppressed automatically after a delay which can be user defined. This is true for bulletins and private mail.

- The forwarding is optimized between BBS using FBB protocole type. It is more efficient on a VHF/UHF network. This kind of forwarding can be disabled by configuration.

- The compressed forwarding allows the reduction by a factor of about 40-50% the quantity of data to exchange in big messages. The messages are protected by checksums, then the transfer is made error-free.

- The forwarding is simultaneous on the various ports regardless they are incoming or outgoing. There might be several forwardings outgoing per port which number is set by parameter. The number of incoming forwarding is a function of the available channels. The time and the period of forward can be set separately on each port.

- The hierarchical routing is supported.

- The ping-pong phenomenon is automatically detected and an information is

given to the sysop by a system message.

- Messages and bulletins for SYSOP are duplicated to a destination call which can be defined by configuration.

- A detailed log of the BBS activity is maintained and a statistic analysis program, written by FC1MVP, is also available.

- Binary transfer is supported with the usage of the YAPP protocol of WA7MBL. An extension to this protocol has been made, including the automatic restart and the checksum, should a stop has occurred or a disconnection took place during the transfer. This extension to the protocol works with the TPK, packet terminal program written by FC1EBN.

- Gateway between connected stations or with another port.

- Conference within the limits of the available ports and channels.

- Language: at the first connection, the connect language is attributed to the user, depending of the callsign.

- Remote SYSOP operation is supported and the housekeeping of the BBS messages, mail and old mail is done each and every night at low activity period which can be parametered, and is done automatically.

- Works under DesqView.

73, Markku / OH2BQZ

P.S. I do not act as any kind of distribution or contact point for this
software other than maintaining ham archives at nic.funet.fi.

        I believe the problem is that AX.25 is more "aggressive" than
TCP/IP and will therefore, take all of the channel time when conflicts and
collisions arise.

Packet will attempt a retry and the voice user will notice the
lack of courtesy-tone/hang-time and issue a ker-chunk or key-down
for a few seconds. Once the user "captures" the voice channel,
then we only contend with packet transmitter carriers.

Good point to consider. We would probably reduce the retry count
and run the packet transmitters at the lowest power for a
quieting signal into the box. Voice users would then be able to
capture most of the time.

Admittedly, this combo is not the perfect setup. All we want is
to get off of the crowded packet channels, reduce the need for
digipeats, and have longer than user to user distances. We don't
want much I guess.

Has anyone hooked the high-speed port of a Ottawa PI card to a
CSU/DSU running 56 KB/S? I just got two PI cards, and lacking yet
the WA4DSY modems, thought i'd try something else - upgrading an
existing landline 4-wire circuit (2 miles) now using short-haul
async modems at 9600 bps, to 56 kbps, using a pair of spare CSU/DSUs
as line drivers. The CSU/DSUs are Codex 3500. They have DB-25
connectors strap-selectable as RS-232 or V.35, of which the RS232
appears preferable here (it's unbalanced, where V.35 has some
balanced pairs.) Looks like, at first glance, I just need to
hook up RS232 drivers and receivers to convert the PI card's TTL
in/out to the CSU/DSU's levels (or bypass something in the CSU/DSU),
and wire the appropriate ins and outs together.

Any ideas? Anyone done this?

Can a standard modem be used with poor man's packet? I have a zoom external, and can purchase some used hayes modems (1200 baud) for $15. Can these be used with PMP?
Also, how would you connect from the modem (standard phone type cord jacks) to a hand talkit?

Due to numerous requests I am posting modification instructions for the Paccom NB-9600 G3RUH modem to convert it to TTL input/output to drive a Kantronics D4-10 at 19.2Kbaud. Don't forget to change the radio speed jumpers in whatever TNC you are using to 19.2K after these mods are done.

I mention this only because I spent one hour trying to figure out why my mod wouldn't work, only to finally realize I never changed the TNC SPEED

to 19.2K to drive the blasted modem! (what an idiot huh?) It's the simple things that getcha! :-)

---

5 Feb. 92

G3RUH Modification to convert to 19.2K and drive a Kantronics D4-10 through the TTL port. All part numbers given are for the Paccom NB-96 modem.

1. Receive audio in to receive data in (conversion to TTL input) mod.

   A. Locate U10 pin 2, and circuit board trace going to U5 pin 2.

      1. Disconnect output of U10 pin 2 by either lifting the lead leg on the integrated circuit or by cutting trace. Lifting the leg on the IC is the easiest way to go about it.

      2. Connect TTL receive data input from the D4-10 to trace going to U5 pin 2.

Note: On Kantronics 19K2/9K6 modem, they actually put in a jumper that lets you either drive U5 pin 2 directly from a TTL source (such as the D4-10) or when the jumper is installed, the input to this stage reverts to normal G3RUH operation with U16C acting as the Rx filter for the analog input.

2. Transmit audio out to Transmit Date out (TTL output) modification.

   A. Locate U18 (74HC164) pin 3 and trace going to Jumper-1 pin 1. Please note that Jumper-1 normally is jumpered from pins 2 to 3 with a header jumper.

      1. Connect wire from from Jumper-1 pin 1 to D4-10 transmit data input.

Note: On Kantronics modem, they do the same thing. They disconnect the output of U18A (after C34) with a header, and allow you to drive the output with U18 pin 3 or the analog output from U18A determined by the position of a header jumper. If it is desired to disable the audio output of the G3RUH modem, you can cut the trace after C34 or remove C34. I did neither and just let it run since I was no longer using the audio output, and I saw no harm in just leaving it run.

3. Lock Detector modification.

   A. Locate resistor pack RS-2. It is a 100K resistor pack and its only purpose is to give 100K of resistance between pins 1 & 2 and 3 & 4. The other resistors in the pack are unused. The goal here is to change this resistance to approx. 50K, and there are a couple of ways to achieve this as listed below:

      1. Cut traces to RS-2 and install two 50K resistors. One between pins 1 & 2, and another between pins 3 & 4.

2. Leave everything intact and place a 100K resistor across pins 1 & 2, and another across pins 3 & 4, this will form two parallel resistor networks with each one offering 50K to the circuit. I used this method. Not much room to work on the board for this step and soldering is in very tight quarters.

3. Use the unused portions of RS-2 to do the same thing as #2 above using shorting wires.

Note: The value of 50K for the lock detector was chosen from notes given in the Paccom NB-96 manual. I have been experimenting with these values and have achieved what appears to be better results with values different from those reported. However since I can not document WHY that is happening, and since it might be limited to my application, I will not go into details on what values I am using. I merely point this out so that if you happen to notice what appears to be poor DCD detection on what appear to be good signals, this might be a good first place to look.

Note: There were some suggestions given in the past to modify a Kantronics DVR2-2 to work with the NB-96 modem at 9600 baud. These suggestions consisted of bypassing one resistor and changing the value of another IN the radio. The net result was to increase the audio output level of the radio to the modem, and to lower the transmit audio input level from the modem to the radio. I have found that increasing the audio output of the radio to the modem often-times results in WORSE performance and would recommend keeping it stock.

However, lowering the transmit drive level is required but it seems to make more sense to do this in the modem rather than in the radio. If a 47K resistor is placed in series with transmit audio output (INTERNAL to the modem) then it will duplicate Kantronics design, and will offer easy adjustment of transmit deviation whether you are using a DVR2-2 or a D4-10. Of course this is only necessary at 9600 baud, as when the above modifications are done, the output of the modem is TTL and not analog.

I am attempting to put together a satellite ground station to decode NOAA and GOES satellite images. There are several stumbling blocks in the way:

- I have an AEA-PK232A. Supposedly this supports WEFAX decoding, but the operating manual that comes with it just suggests buying AEA's own software. I want to write my own, but have no information on what format the demodulated picture will be in when it appears on my computer serial line.

- Where can I get a 1691 MHz -> ~137 MHz downconverter and what is it likely to cost?

- Where can I get ~2 ft of 9913 RG-8U? The only source I've found so far is AES, and they only sell it in 100 ft rolls (according to the catalog).

- Does anyone have any comments on modifying scanners in the 137 MHz range to get the 30-50 kHz bandwidth required?

Thanks for any help.

>6 or 7ms, adding the several hundred milliseconds that many RF-sensed

>amps need to switch is a real downer.

On the other hand, it's not too much trouble to run a new wire into the amp and connect it to the PTT circuit in the associated transmitter - that way you don't have the delay in the RF sensing circuit to deal with.

Typical clapper-type relays switch in 4 to 5 milliseconds, so the relay isn't going to be a timing problem when keying up. However, they DO take longer - sometimes tens of milliseconds - to UNKEY. This is worsened by spike diodes.

I suspect that some sort of totem-pole driver that would short the relay coil on unkey would significantly quicken the unkey time, but it'd have to be a pretty beefy transistor. Luckily, TV horizontal output transistors are only a few dollars.

This begs the question of whether the relay would survive typical packet duty cycles.

I have been using the antenna relays out of old junk Motorola radios for my 56kb stuff. They are reasonably fast, and they're of sealed-reed construction, so they may survive.

Does anyone know of a combined 2 meter radio/TNC? This would seem to be a logical combination. Thanks.

Really? The few electo-mechanical switches I've looked at (they were
attenuators along with T/R switches for a 432 MHz EME station) appeared
to switch in a few milliseconds but then they often bounced after
another several. I didn't feel too comfortable in applying lots of
power until 20 milliseconds had gone by. Maybe I just tried the wrong
brand.

How about using Mitsubishi (or anyone else's for that matter) MD00X
series of PIN switches? They switch very rapidly, under a microsecond,
and take lots and lots of cycles. The "H" suffix generally are spec'd
to handle at least 25 watts. I've used these at 900 and 1200 MHz with
great success but there are also versions for 140 and 440 MHz territory.
I think if enough people called RF Parts that they might finally
actually get some in stock. I've asked them for them several times and
they've said something like "yes, we can get them if there is interest"
but I guess I never had enough $'s to get them to count it as interest.
I'm using the MD003H and MD004H in the 900 and 1200 MHz radios and they've
been great. Varieties of the MD001 and M007 work at vhf and low uhf.

Another alternative is to buy a few Unitrode (or other) PIN diodes and
build your own. I think Microwave Components of Michigan had parts a

while back and they may still. It should only cost a few dollars
for even a fairly high power switch. Insertion loss is generally between
.5 and 1 dB for the ones I've used.

 Im having a bit of trouble with the mailer & ka9q software.
After a lot of experimenting i am running this way:

1. domain.txt - has only callsigns, not "callsign.ampr.org."
2. domain suff null - the suffex(sp?) is not specified ie "ampr.org."
3. mail to "ted@n6trf" get thru fine & most of the time i have no trouble
   with addressing.
   However, when mail is sent to "n6trf" i get "n6trf.ampr.org not found"

So before i paint myself into a corner would you pse advise me on what i
should be doing (as above) or whatever so that "ted@n6trf" & "n6trf" both
work as good addresses. Thanks in advance.

|
| 97.109d essentially says that stations under automatic control and passing
| third party traffic must use AX.25 protocol. The originating station must
| not be automatically controlled.
|
| So unless you pass NTS traffic, you don't have to use AX.25.
+---------------

I beg your pardon, but the definition of "third party traffic" in Part 97 is
such that digipeating and NET/ROM and IP packet forwarding qualify. You can
therefore omit AX.25 Level 2 only for direct point-to-point links not running
e.g. POP.

This is annoying.

No. In general most telephone modems *cannot* be used for 1200 baud packet.
Most UHF/VHF 1200 baud packet uses Bell 202, which is a half-duplex FSK
protocol. Some old, old modems implement this protocol but you don't
find them around much anymore: they usually get thrown away.

Can anyone tell me (pref. in mail) where I could get information about
repeaters (prices + facilities) particularly Digital Repeaters for the
2m and 70cm bands? I.e companies to write (snail or email) to, etc.

I live in a rather nasty area surrounded on three sides by rather high

hills. There are a number of people in my area wanting to experiment
with packet, but unable to get reception with any reliably unless we go
to ultra expensive antennae - if we join as a group we could get a
repeater and save ourselves some money. I know this isn't the best
solution, a better antenna would give coverage to all the frequencies
in the 2m band, but packet people tend to get some serious flak from
the voice operators if we don't stick to assigned bands.

Packet uses Bell 202 tones while your Zoom and the Hayes 1200 use Bell 212
tones. They are not compatible. The "smart" in the smartmodems also gets
in your way. The original Hayes Smartmodem had a method of using the 300
baud speed over radio. There's instructions in the back of the modem manual.
That would be compatible with HF packet, but your program would have to
use "AT" commands to switch from transmit to receive. All in all it's a
losing proposition when a couple of Exar chips or an AMD7910 make a perfectly
satisfactory packet modem for a few bucks.

I have a couple of AmigaNOS questions:

1) Is there a command to instruct AmigaNOS to constantly update all
   session windows instead of only the currently active one?

2) How do I change the default timezone from GMT to EST since I have my
   machines clock set to EST and it puts "GMT" after the time?

3) Has anybody successfully used AmigaELM instead of BM for a mailer?

        But if we do have a Bell 202(A?) compatible modem, how might we go
about making a TNC out of them? Is it possible at all. It seems that my
old GVC 1200 had a command 'ath4' that was for special external connections
(some connotations towards radio were mentioned). A relay clicked inside
the modem but the phone was not taken off of the hook.

I just installed a new news system today on UCSD (where the internet
gateway for these digests is located), and because of a minor typo in
one file (forgot a negation sign), we dumped several hundred
completely irrelevant messages into these digests.

Humble apologies. Arrgh!

It will probably take a day for them to clear out.

Ah well, as my school advisor used to say:
     "Never make small mistakes. The large ones are easier to spot."

The AmigaNOS v2.8s mailbox command [P]age returns an error code.
The akit28s files contain a sample NOS-startup file that includes the line

amiga command "NewCLI From s:server-shell"

I can't find a file in the AmigaNOS 2.8s archives called "server-shell"
My guess is that it is needed to open a console window for [P].

Can anyone get me directions?
Thanks

     Old Bell 202 modems can be used on packet. In fact, that's what
was first used back in the "old days". I've not used any old telephone
modems on packet, so I can only speculate on how to go about converting
one. You have to figure out:

(a) how to hook up the radio
(b) how to interface the modem to the TNC or computer (might have to worry
    about RS-232 or TTL level conversions)
(c) if your modem is a smart modem, you have to figure out how to command it
    into the 202 mode after you've done (b)

     After you've done all this work, you still just have a modem (you
need a TNC). Unless you have a garage full of surplus modems, it's probably
not worth the trouble.

     If you can, ignore 1200 baud packet and start at 9600 baud or faster.
If you must have 1200 baud, build a modem around TI's TCM3105 chip. Its cheap,
stable, low-power, needs only +5, and works very well.

I just found out that it is possible to run 4800 baud on VHF. Does anyone have a list of radios that are capable of being modified to use either 4800 baud or 9600 baud packet modems? For example, can an ICOM IC-2AT, Alinco DR-112, or a Kenwood TM-221-a be modified? If so, what needs to be done? It would be nice if there was a file that contained what radios could be modified to use the high speed modems, and what steps were needed to do the modification.

Sorry to pollute this group slightly. But I thought that maybe someone here might be able to help me. I am looking for a Baudot terminal so that I can talk to my deaf friend without using a relay service. I don't want to spend the several hundred $'s to buy either a new TDD or a Baudot operable modem.

I had the idea that TTY's used to use Baudot. Is this correct? If these, would be compatible does anyone know where I might look in the Chicago area for an old surplus Baudot TTY. (I have a good understanding on today's modems but other than knowing that the deaf's TTD's use different frequencies and a different encoding technique (Baudot instead of ASCII), I don't know much about the older equipment.

Hi all,

well i've finally gotten around to getting v1.01 out.
It is now in incoming on ucsd.edu (could you please move it, Brian ?)
with new source, exe and docs (src101.zip, wg7j101.exe and wg7jdoc.zip)

All this, and a few other configuration executables can also be found
on wg7j.ece.orst.edu.

Some new features are:
- Tracing to a session or to the command screen. (you can disable this
from the command line to save 4 kb memory). F9 will toggle to the trace
session from any other session (this is modified code from wnos sources)

-Function key session switching. F1-F8 will switch to sessions 1-8
from any other session, IF they are NOT defined as function keys

-inactivity timeouts in the mailbox, the ftpserver and netrom l4

-bid's in the history file have a timestamp.
 new 'oldbid' command will delete old bid's from the history file
 (and also update old pre-datestamp entries with a datestamp)

-very simple message expiration; inspired by Bernie Roehl's expire.c
a process can be configured to run every n hours; it checks a control
file /spool/expire.dat for filenames with maximum age value (in days)
All messages older then the maximum are deleted (after the whole file
is backed up...)

-you can now exclude names from the mailbeacon with 'mbox mailfor exclude'

-mailbox commands
LL,SR are fixed from 1.0
new SC to send with carbon copy, RH same as V, and XM to set more prompting
More prompting now works in any mode, not just telnet login's

- R-header interpretation now takes all of @:xxx, @xxx, ?:xxx and ?xxx

- NTS message deletion; in order to allow users to deliver traffic
and then delete the message in the area, ALL users can delete ANY message
in areas starting with "nts" ... so ntslocal, nts, ntsor all work

-BuckMaster CDRom support
This code was send to me and i've added it as is. It has NOT been tested
by me, and is provided as is... It is not in the standard distribution,
but there is an executable on wg7j.ece that has the code compiled in.

There are a few other little things; see the readme.now file
Please also read the minimanual wg7jmods.txt in wg7jdoc.zip
(also has help files as i use them)

Enjoy,

Johan,
WG7J/PA3DIS

I just posted my introductory documentation for NOS to the
hamradio/packet/tcpip/incoming directory at ucsd.edu.

It's designed to be a useful guide for folks who know something about
packet but are just getting started with NOS. It includes sample
configuration files, etc. Preliminary reviews have been favorable, so
it might be worth a look...

It's "intronos.zip" and is in plain vanilla ASCII format that should
display or print on just about any hardware without problems.

I believe that FCC regulations allow the use of any digital code above 50 mhz,

except for unattended traffic forwarding, and subject to appropriate sub-band restrictions. There are bandwidth requirements, and a code description must be maintained in the station log.

This is no doubt a very contentious problem...but I completely disagree with the concept of not having an amateur responsible for their transmissions. Personal responsibility goes to the heart of the amateur radio hobby. It may very well be that PBBS' will have to undergo a drastic change in the future...however, that seems to me a better route than approaching the FCC with the idea of relieving certain stations of any responsiblity for their actions. This experiment has already been done on 11 meters, and the result is one which the FCC would probably rather not repeat.
Even the phone boards have restrictions on content, why should the PBBS' be any different? If you want to run a PBBS, then you have to be aware of the current regulations covering unattended forwarding, and be willing to abide by them.

What is the absolute minimum set up to run 2400 bps packet? How about
9600? I'm new to this (like you couldn't tell?) and would appreciate any
advice, experiences, recomendations, etc.

dave.

Hi All. I'm a new user of tcp/ip and have about
a thousand questions. Rather than clutter up this
system with all 1,000, wonder if someone can point
me to a good tutorial, beginner's guide or similar?
Most of my questions relate to routing and similar.
Thanks for your help!

Subject: NEPRA Packet Meeting Sat Apr 11 @ 1PM
Message-ID: <BMF56y.FLD@world.std.com>
Summary: New England Packet Radio Meeting this saturday
Keywords: NEPRA MEETING
Organization: The World Public Access UNIX, Brookline, MA
Distribution: ne
Date: Thu, 9 Apr 1992 02:20:58 GMT

The next meeting of the New England Packet Radio Association
will be held Saturday, April 11 at 1:00 PM. This month
will focus on BBS sysop issues from "How to setup a proper BBS"
to "Forwarding mail in New England". A beginner's session will
start at 1:00 PM with the main meeting at 1:30 PM.

Users are invitied to participate with questions or suggestions
on all aspects of BBS operation from "How to start using a BBS"
to "How to use the Server features".

Note: The meeting will be held at the MITRE Corporation in
Bedford, Ma. Easy access at the junction of Routes 3 and 62.

Directions:

From Route 128 in Lexington, take Route 3 North one exit to
Route 62. At the end of the down ramp (at the traffic light)
turn right (East) on 62.

From Route 495 in Lowell, take Route 3 South to the Route 62
exit - about 6 miles. Turn left (East) at the end of the down
ramp and pass under Route 3.

MITRE is the large complex immediately on your left at the
second set of traffic lights. Enter the MITRE driveway and
bear left at the fork.

Either:

Drive around the two story garage, pass over two speed bumps
and turn right into "PC" parking lot. You pass first a two
story Power House building. The cafeteria is a one story
building further along on your right.

Or:

Park in the two story garage at the top of the small hill
after entering the MITRE driveway. Use the asphalt walkway
around the south side of the building under construction
heading east between the two two story buildings marked "B"
and "D" to the next one story building marked "C" on your
right.

In either case, enter the cafeteria (one story building) down
a narrow hardtop walkway.

TAPR's got some of this information. It happens that the Jan '92 PSR
has the connection points for the TM221. RX can be gotten from
IC1-pin 9, and TX may be be injected at connection #7 on the VCO

assembly on the TX/RX unit. There's more information in the article.

TAPR can be reached at 602-749-9479

GIGABIT Testbed Activity

Background:

  On pages 10-13, March 1992 issue of IEEE Network Magazine, there was a very interesting article entitled "Where are we with Gigabits". This guest editorial referred to all of the gentlemen mentioned above.

Kennedy Activity:

  The KSC is interested in exploring GIGABIT architectures. In fact, a small embryonic project has been funded to establish a "test-bed" of sorts. This test-bed is not of the academic sophistication level of others (i.e. AURORA, CASA, etc.), but is a first phase concept exploration project.

KSC is interested in testing the feasibility of using a GIGABIT architecture to consolidate several divergent communication transmission systems used to support the operations and launch of the Space Shuttle.

Requested Dialoge:

I am interested in exploring the possibility of communicating with other individuals to compare notes and lessons learned. If interested please reply via e-mail. Thank you.

Sincerely,

David Sweigert

|> This is no doubt a very contentious problem...but I completely disagree with
|> the concept of not having an amateur responsible for their transmissions.
|> Personal responsibility goes to the heart of the amateur radio hobby.
   ^^^^^^^^^^^^^^^^^^^^^^^^
Exactly. But that's why the FCC *interpretation* should be changed. The one responsible for a message is the originator, not the PBBS that forwards the message. Store and forward censorship is almost doable; how could you possibly do things where the entire message was never at your site at one time?

|> Even the phone boards have restrictions on content, why should the PBBS' be any
|> different?

To my knowledge and based on experience, there are *no* restrictions on content on a phone BBS (other than, possibly, aiding and abetting a crime). There are certainly no restrictions on commercial activity or obscene/profane

messages.

Hello:

I have *no* experience with radio, except using my little Sony-2010
shortwave. I am, however, very interested in getting started with
things like packet radio. From what I understand, I can get a
Novice or Technician no-code license from the FCC that will allow me
to do voice/packet work above 30 MHz.

Could someone point me to sources of further information? Is
there a compiled FAQ for this group?

Some specific questions I have about packet radio:

- What kind of equipment do you need?
- How much does this cost?
- What kind of license do I need?
- Are there people in the Madison, WI area that are also
  doing this?
- What can you do with packet radio? Messages? BBSs? UUCP?
- I currently have a Sun Sparcstation 1 as my home computer. What
  kind of software do I need with packet radio. Has anyone used
  a Sun (or other Unix machine) for this kind of stuff?

Please email me or post it here...
Thanks in advance to any kind folks who can help me out.
I appreciate your time and attention.

Cheers,

Jon

Greetings! I made a layout for the boards [Two sided with ground plane] but never ended up making the boards because I couldn't order the GUnnplexers that the article called for. Even after correcting the typo on the phone number in the ARRL guide, I found that the part in question hadnt been made for "a coujple of years now ... "   If anyone else knows a source of these, I'd be glad to root through my backups and find the artwork for the board. It's about a one evening project. In fact - I'll get PC Boards MADE and sell them at COST just to get more people to USE this mode. Will people be needing High-Speed Synch cards for various machines too? I don't know where to scrounge one up, and figured I'd just point-to-point one when the need came. [I've got a Mac and a 3B1 in my packet station]

Besides assorted do-it-yourselfers, there's the new Alinco that's
advertised in all of the latest ham magazines. It's called the
DR-1200T. It comes with 25W output, a TNC cable, and 2400 baud
capability. The microphone is optional!

You can assume that the deviation is set properly for data, and that
the TX/RX switching is fast. It sounds like you hook it up to a
computer & start transmitting.

I haven't seen one myself. Has anyone played with one?

call (310) 616 8616 for info or see QST, 73 or CQ.

It sounds like your typical voice radio. For example, Kantronics
sells a 2400 baud modem that uses QAM (?) that requires the same
bandwidth as 1200 baud, thus you don't have to make any mods to your
voice radio. I think that is where they get the 2400 baud speed.

>You can assume that the deviation is set properly for data, and that

I would more assume they are not. It looks like they took a voice radio
and just re-labeled it w/o a microphone.

>I haven't seen one myself. Has anyone played with one?
>
Nope, so I am just going from the pictures. I may be speaking unfairly
about Alinco. If they did provide a 9600 baud capable radio, then
that would be something to talk about.

In our Digital Communications class here at Willamette University, our group's project involves using ka9q on a couple of TNCs (PK-232MBX TNCs to be exact). The documentation for ka9q describes how to activate KISS mode on the PK-232 (first you activate KISS mode using some terminal program, then run ka9q), but it doesn't work on TNCs. We are using PC Packrat as the terminal program, and are sending commands to the TNC. It works fine until we hit the command KISS ON, at which time no other commands may be entered, and the only solution is to exit the program and reset the TNC. Our professor has been no help, as he has never used KISS mode on these TNCs. If anyone can help, and/or has used

ka9q with IBM compatable machines, please respond via e-mail. Thank you.

I have written a document entitled "Beginner's Guide to TCP/IP on the
Amateur Packet Radio Network Using the KA9Q Internet Software."
Version 2.0 of the guide documents the use of NOS 911229 (PA0GRI v2.0h)
and BM v3.3.2.

The document is available in three forms by anonymous ftp from
filbert.eecs.ucdavis.edu [128.120.57.123] in the directory pub/ka9q.

"nosbgnlp.zip" unzips to a 66 page ascii "line printer" document,
which can be printed with the UNIX lpr command.

"nosbgnps.zip" unzips to a 54 page PostScript document, which can
be printed on a PostScript printer.

"nosbgnpr.zip" unzips to a 66 page ascii "print" document, which
can be printed using the DOS print command. You will need to send
control codes to your printer to control the page offset and you
should turn perforation skip off.

I am unable to provide access to this document in any way other
than anonymous ftp. Those of you who do make it available in
other ways (on a BBS for example), please let me know and I can
pass this information on to those who inquire.

Comments and suggestions for change to the document are welcome.

Hello all,
  I've sent the previous posters on this string a short newsletter which
n6rce and I recently sent out to update and aid those building or thinking
of building the data links.
  Please drop me a note if you would like a copy.

very 73

Thanks for taking the time to put together the documents
introducing beginners to TCP/IP and making them available via
FTP. Unfortunately, when I attempted to FTP to filbert... and
login as "anonymous", filbert... responded with "unknown command"
Are you sure the system is set to accept anonymous FTP logins?
Thanks es 73,

Will Snyder/KB4LFD

From my posting yesterday:

>> The document is available in three forms by anonymous ftp from
>> filbert.eecs.ucdavis.edu [128.120.57.123] in the directory pub/ka9q.
                                            ^
                                            ^
Argh, I blew it -- the ip address is 128.120.57.121. If you ftp'd
to the ip address, you would have a problem. However, ftping to the
hostname works OK, as confirmed by the pile of email I have received
this morning.

Sorry for the error.

I have an Alinco DR1200T radio and it works quite well. It is true FM, and
while it does NOT come ready-to-run 9600 baud, the modification for the
G3RUH modem is very simple.

It ran, out of the box, right away. It does *NOT* come with a TNC cable,
but does come with 1/2 of the cable (the mic end).

It's nothing more than a 112T without the microphone and mobile mounting
bracket. Oh, except it's $50 less. Where else can you get a rock-solid,
reasonably fast 2m radio for $270?

Paul

If NET/NOS stations use mode VC, they will be more aggressive and have
a more equal footing with ax.25 stations.

If ax.25 stations run sensible settings, they won't preempt tcp/ip
activity that much.

The first is kind of wasteful (as well as other problems mentioned in
this newsgroup regarding mode vc); the second will work until the

channel gets busy and some impatient ax.25'er gets tired of waiting
for "his" turn while trying to read every bulletin ever posted on his
PBBS and "tweaks" things to "make them work better", and finds that he
now "owns the channel" :-(

(Now for the inevitable 9600 baud plug ;-)

If we'd get our collective heads screwed on correctly and move to more
realistic speeds than 1200 baud (at that speed, an acronym for "Boring
And Usually Dumb" ;-), this would not be a problem.

We have a shared BBS-forward, tcp/ip, and ax.25 end user 9600 baud
channel (439.025) in Los Angeles, using TEKK radios for the most part
(which have been working well enough for most of us), with around 15
tcp/ip users, a handful of ax.25'ers, and several BBS forwarding ports
(to which the sysops have most generously allowed end user access) and
it works euphorically well. Even with BBS forwarding, which _does_
hog the channel, it only requires a few minutes, after which ftp's,
etc., resume on their own.

All this on a standard 25 KHz channel - and it'll work on any channel
width that will support 1200 baud AFSK!

Does anyone out ther have any experience with "Poor Man's Packet?" there
was an atricle in last years '73 magazine - august, I believe, which
described how to build a modem to use PMP. I could really use your help
in getting a copy of this article. Can it be scanned and sent to me? Or
Xeroxed and mailed - I'll cover costs. Please help.
   Oh, yes - I got my ticket yesterday - KD6HIJ.

Ovenizing the LO would certainly help, and that's exactly what I would
suggest doing if and only if you are dead set on keeping the Tekk
radios. I don't know much about the Tekk radios but what I have seen
is not very favorable. Since I don't have exact measurements in hand,
I won't comment further. But suffice it to say that you will need to
do a little work to have reliable data communication with the Tekk
radios.

I'd be interested in hearing some first hand comments about the Tekk rigs.

>Also, what is available for 440 that would work well at 9600
>or faster? Specifically, what are your thoughts about the
>Ramsey, and Kantronics radios? Any others that would fit the bill
>easily? Has anyone tried modifying commercial gear for this?
>Inquiring minds want to know. :-)

Here in New England we have a few PacketCluster backbone links running
9600 baud with G3RUH modems and Maxon commercial 440 MHz mobile radios. The
Maxons are very easy to modify and work flawlessly once set up right.
I forget the model numbers but if you're interested you might contact
N1DCS in Connecticut for more info. There are surely other commercial
radios that can be used...but I don't have a list of them handy. But
basically what you want is a true FM radio....then you just have to
find the varactor for transmit and the discriminator point for

receive.

Also, I have heard good things about Alinco but am not sure what
they're offering for higher than 2400 baud radios. I know they have a
2m radio (DR-1200T) that will do up to 2400 baud....anyone know about
any 440 MHz offerings from Alinco?

Then there's the Kantronics DVR series......I'd stay away from these
at all costs. The receivers are very broad and you are guaaranteed to
have troubles in high RF level environments.

>(Looks like another visit to Dayton..)

Ya got that right! If you just have one link in mind then buy two
cheap commercial radios and get them running.....

Yeah, that's right.
A AX25 connect doesn't send a note to the keyboard, simply because the
connecting station ISN'T connected to the keyboard! Whenever you CONNECT
(in AX25) a NOS station, you'll discover you get the NOS mailbox. Depending
on whatever version of NOS you have running, you can issue a command to

connect the operator:
WNOS/HRLNOS/MINIHRL: c(onnect operator)
GRI/NOS (2.0)   : op(erator)
In these circumstances "mbox attend" MUST be enabled and the ttylink server
MUST be started (with "start ttylink")

The remote user can also issue the command:
telnet <hostname_of_this_bbs> 87
to connect to the console... In this case it is not necessary for the mail-
box to have the "mbox attend on".... It will try to connect anyway...

If there are still questions, mail me...

          Best regards, Ramon

If you call the ``Children's Make a Wish'' foundation, you will find that they are not soliciting any form of card for Craig Shergold or anyone else. Better yet, if you call the Guinness people (US publisher is "Facts on File" @ 212-683--2244 ext. 336), you can get this same story confirmed. You will also find that they will no longer endorse or support any effort to break this record.

Many years ago, Craig Shergold had a brain tumor, believed inoperable. He sought to set the Guinness record for get-well cards. The call was well-publicized, and he did, indeed set the record (consult a recent edition of the book --- he has received in excess of 16 million cards to date; he officially set the record as of 17 Nov 1989).

As part of this whole story, his plight caught the attention of John Kluge, the US billionaire, who paid for Craig to come to the US and receive specialized treatment. As a result, Craig has recovered completely from his tumor. He is also no longer seven, but well into his teens (you can see how out-of-date the request for cards is from this -- it's like circulating a letter encouraging people to vote for Carter for President).

The problem is that the mimeographed sheets and letters seeking cards for Craig have continued to be circulated. As a result, cards continue to pour in to the post office for Royal Marsden Hospital in England. Worse, the appeal has mutated into various other versions, such as an appeal for business cards, one for postcards, and another version that appeals for holiday cards.

The Shergold family has publicly appealed many times that people cease to mail them cards and letters, and that no more appeals be made on their behalf. One easily accessible way to verify this is with the article on page 24 of the 19 July 1990 NY Times. People Magazine wrote an article about it on June 1, 1991, page 63. Even Ann Landers has carried an item on this [6/23/91], but people still keep trying to send cards. Both Guinness and Royal Marsden have repeatedly issued press releases asking people to stop circulating requests for cards, as they are creating an undue burden on both the hospital and the postal service.

The Guinness people have discontinued the category to prevent this kind of thing from ever happening again, and are doing their utmost to kill any further mailings. The Royal Marsden Hospital is at a loss what to do with the cards that continue to arrive --- most are being sold to stamp collectors and paper recyclers, and none go on to Craig.

This appeal for Craig, as well as many urban legends, regularly appear on electronic bulletin boards around the world, and in many organizational newsletters and bulletins. It is both heartening and unfortunate that there are so many well-meaning people who continue to

propagate these stories. It is too bad that so many people are unwilling to verify their information before passing such things along, especially when a simple phone call will suffice to do so. In this case, opening a recent copy of a book carried by nearly every library and bookstore would illuminate the situation.

If you would still like to do something for a dying child, consider making a donation to a charity such as UNICEF or to the International Red Cross (Red Crescent, Red Magen David). Many thousands of children are dying daily around the world from disease and starvation, and countless millions more are suffering from the ravages of war, famine, disease, and natural disaster. Think how many of them might be helped by the millions of dollars in postage spent on cards to Craig Shergold.... Addresses (in US) are:

```
UNICEF               American National Red Cross
1 UN Plaza         17th & D Streets
New York, NY 10017   Washington, DC 20006
              Attn: international children's aid
```

[Also, I encourage you to save this announcement, in either electronic or hard copy form, and to post it to any bulletin board you've seen the original plea on. If you see it in the future, as you probably will, you can attach a copy of this announcement. Wouldn't it be great to finally kill this story, which spreads like a virus? - MRH]

At least WRT the UHF radio (the D4-10), that's not true. It's got a
respectable front-end with two helicals before and two following the RF
amp. The 2M model is another story.

As I've mentioned in some other posts, we've been playing with the D4
radios (starting with a pair of beta models) for over a year, and have
been quite happy with them.

After experimenting a bit this weekend I restored the MTU value to it's
original number and the system still works fine. The buffer must be 1
it seems however. AmigaNOS thinks it is sending characters out with a
value higher than 1, but really does not (the TNC does not transmit) and
AmigaNOS never receives anything. Guess I'll stick with a value of 1
until I can get an updated driver. I don't notice any degradation
anyway, seems to run just as well as the internal port.

I've been told by my local PBBS sysop to leave off the "@ NTSCA" when
the destination is within the state. Is that just a bug here or is that
common practice elsewhere?

Chris, sorry to hear you are having trouble getting the TAPR DCD State Machine
Mod to work with your PK-88. I think I may know what the trouble is.
I detected a misprint in the instructions calling for the installer to
solder one of the leads to the wrong pin on the Am7910 when I built and
installed the DCDSM in my PK88. My documentation is at my home QTH presently,
so I can't tell you exactly what the misprint is. I think the instructions
say to solder the RX line to a pin other than 26 on Am7910. In fact, the pin
TAPR specifies is not even listed on the PK-88 schematic! Here is what you
need to do: Pull out your PK-88 manual and turn to the schematic on Page D-1
(Appendix D) and check the DCDSM instructions against the schematic. The
schematic lists all relevant pin numbers and line descriptions (Thanks AEA).
If you come accross an instruction to solder a lead to a pin that is not
listed on the schematic, you have found the misprint. Ignore the misprint and
solder the lead to the correct pin.
Also, after you get your DCDSM working, set CUSTOM bit #0 to 0. This allows
receipt of packets even when the signal is not strong enough to trip the DCD.
Though my DCDSM works fine, it will occasionally ignore a valid packet.
Setting that bit improved my throughput immensely.
Hope this helps. Please let me know how things work out. Lastly, good luck

getting the DCDSM inside the case! I had a time with that myself hihi.

It's not a bug. Proper usage will depend on the originating BBS.
Some software has forwarding files that will automatically append the
proper '@NTSxx.state.usa'. Others do not. Follow the proceedure set
by your BBS SYSOP.

My BBS will append the proper routing to a 'ST 19460' input, but
if I were to input 'ST 19460@NTSEPA' it will sit waiting for SYSOP
intervention since that is not in the forwarding file.

Practically all BBS software has help files. Use them in conjunction
with questions to the SYSOP if you don't understand the help file.

Does anyone have any information where I can get the PHS software? It
evidently is like the THS software for the DRSI card, but runs on the
PK232 by AEA. I am a little hard to get a hold of on this Net.

As its a Fido Net link into this forum. But any info would be
appreciated.

Has anyone successfully run packet on an HP 95LX palmtop computer?
It has a somewhat non-standard 4-pin serial port with just, RX, TX
and ground and none of the other pins needed for DCD, hardware handshaking,
etc. It *is* compatable with most DOS programs and has a decent built-in
communications program.

Thanks in advance,

If you have PA0GRI 2.0 you can set "mbox jumpstart on" to defeat this. DON'T DO THIS IF YOU ARE USING NET/ROM UNLESS yOU GIVE THE NET/ROM NODE A DIFFERENT CALL (another PA0GRI 2.0 feature), AND DON"T DO IT AT ALL IF YOU WILL BE USING "mode vc"! The results if you do are NOT pretty.

AX.25 is a poor wrapper for IP and NET/ROM packets; unfortunately, thanks to the FCC it's all we have. (grrr.....)

The NTSCA is not needed if you are within the state. However, the "standard" is that all BBS within a state should strip off the NTSxx for their state. This is needed to allow the routing by the TO portion of the address rather than the @ portion.

So when a message addressed to 95020@NTSCA arrives from some distant land (like Oregon), my BBS strips off the @NTSCA and leaves the 95020. The routing software sees the blank "@" area and uses the 95020 for routing.

Including a hierarchical address on an NTS message is a waste of
bandwidth. The address already includes the country and state (since
only Canada and US have the NTS system) and the zipcode says where in
the state to send it.

Actually, the NTSxx is redundant but is done to allow routing through
older systems which don't support a wildcard in the routing file and
also makes it easier than trying to figure out which zipcode is in
which state.

a while back, there was a question regarding the use of compression on
packet radio --- I just got a response on that with a request to pass it
along to the net from WA7UGB, so here it is.....

the PA0GRI version 2.0F TCP/IP package uses LZW compression if both ends of
the connect want it.

short and simple....this is a first for me. :-) thanks to WA7UGB for this
info.

I am a medical student working with a cardiologist on several research
projects. One of the things we are contemplating is setting up a
mobile echocardiogram machine (in a van) that would be driven to
remote sites (away from the hospital) and used to acquire echoes from
patients. We would like to try sending the images back by packet
radio at 9600 baud or higher on 2-meters or 440 MHz. It would not be
for commercial purposes, but simply an experiment to see how much data
we can reasonably send back---each image is about 200K, but we hope to
compress them and only send differences.

My question is---can anyone think of any reason why the FCC would
object to this?

     Thanks, Ralph N2HBN (kuntz@umdnj.edu)

It would actually have been pretty simple to add a PID to the outgoing
SABM (connect request) packets in my code. Then I could have brought
up the mailbox right away whenever an incoming SABM carries PID F0
(plain ascii text, i.e., keyboard user), defaulting to the present
behavior of requiring a CR when a plain SABM (no pid) arrives.

Unfortunately, the AX.25 protocol is based on X.25/LAPB, the designers
of which lived B.C. -- before the discovery of the Internet
Implementers' Creed: Be conservative in what you send, liberal in what
you accept. The AX.25 spec specifies that SABM frames (among several
other types) aren't supposed to have information fields, and if one is

seen the link is supposed to be reset with a FRMR (frame reject). It
would have been just as easy to say that unexpected information fields
should be ignored (i.e., be liberal in what you expect) to pave the
way for backward compatible extensions of the protocol, but
NOOOOO.....

I was reading an article from the Packet Register and I saw
something that said
"The Kantronics D-410 radio has a data slicer and has been tested
successfuly with raw data. However, this configuration is not
compatible with any other formats, such s K9NG/G3RUH, but could
certainly be used in a pt to pt application."

Is this true??? If I buy a Data engine with the 9600baud modem,
and the DR4-10 will I not be able to connect to others
on the network using TAPR 9600 baud modems and Motorola rigs????
Doesn't seem right to me...
-Chris

I have just recently purchased a Tiny-2 TNC, and a Kenwood TM-241A 50 Watt
(2m) transceiver.

I run a BBS (phone), and have purchased the gear in order to attach it
to my current system.

Problem: I run QNX 2.15, which as far as I know, has no software to
talk AX.25. I can run a terminal program under MESSDOS, but I want
to use it for the BBS.

Can anyone tell me of anywhere I can get/view code that will allow
me to decode the packeted information that I receive (via RS232) from
the Tiny-2? If you have something, please don't send it, just tell me
you have it. I have to pay for email and if this is a commonish problem,
and I get scads of copies of code then I will be up to my ears in debt!

Thanks in Advance,
Richard

X-Subject: LZW implementation to AX25 S&F systems

hello,
there are already some implementations of LZW compression present. currently
known only in tcp/ip packages. to make it available to other systems there
must be a talk abt. before implementation.
my suggestion for the protocol:

```
SABM            --->>>
                <<<---     UA
[MBOX-X$]       --->>>              ; X indicates the ability of LZW
1. version
                <<<---     [MBOX-$] ; no LZW ... nothing further happenes
2. version
                <<<---     [MBOX-X$] ; able to do LZW, too!
XLZW <bits> <mode>   --->>>          ; variable or constant .. to be fixed
                     <<<---   XLZW Ok ; now they are synched together
                                       ; any further traffic is compressed
```

OR:

<<<---   NO - not supported ; or any other msg

thats it. its just the same way of implementation than in the tcp/ip
packages (SMTP).
remember: only the calling station is responsible to initiate LZW!
the LZW should be switchable. its takes some cpu time, especially on decoding.
the value of "bits" is in the range of 9 to 16. the size of the xferred
mail goes to 70% to 55% depending on the value.
pse send ur comments to '<btitmars@esoc.BITnet>' for QSP to me.
best regards, michael

>If you have PA0GRI 2.0 you can set "mbox jumpstart on" to defeat this. DON'T
>DO THIS IF YOU ARE USING NET/ROM UNLESS yOU GIVE THE NET/ROM NODE A DIFFERENT
>CALL (another PA0GRI 2.0 feature), AND DON"T DO IT AT ALL IF YOU WILL BE USING
>"mode vc"! The results if you do are NOT pretty.
I am the originator of the jumpstart code; as Phil might agree, it is not a
pretty solution, but one that works and at least keeps my users happy !

As for the working of it :
jumstart will never be used if the connect comes from a *known* netrom
neighbour,and never if the interface is in VC mode !
The 'known' is the key in the netrom part; this implies that you have heard
a nodes broadcast from you neighbour, so that your system has identified
it as a netrom system. This could sometimes take a while...

I recently fixed the netrom load command, so you can now load routes (from
previously saved file) at startup. Gerard has added this fix to 2.0h, just
out...

Since v0.95 of my code, i've added a command to setup a list of calls to

exclude from jumpstart. This can be used to avoid things like rspf in vc mode,
and whatever else is causing troubles... This is not is gerard's code...
Again, not the nicest, when you're trying to deal with as many proto's
as nos is, that's the way it is...

My stuff can also be found on ucsd.edu

Actually, it works quite nicely for IP, so long as you operate in datagram
mode and don't fool with that other AX.25 junk.

Hi packet folks,

I appreciate anyone who can relay my "cq" to Bill, VS6CT, a digital ham
in Hong Kong. He is the only digital ham in HK that I've read about so
far. I'm (still) planning buy equipment and would like to get some
advice on what they use in that sector of the universe.

I called Kantronics and asked about that. Their reply was there was no
hardware or software flow control in the firmware which is why frames are
getting trashed.

When I left Wisconsin a few years ago, we had designated 145.03 as a
keyboard channel. At the time, it was pretty well observed. I dunno
what's happened since then; you might contact WB9TYT or WA9KEC who I
believe are still active up there.

I have not used an HP95LX for packet, but I have used only RX, TX, and GND
to control a Pocket Packet TNC. I have used this technique on an HP Vectra
and an HP 110 Portable. My guess is it will work just fine.

Incidentally, I have seen other instances where only these three lines were
used to communicate between a device and a terminal. I believe there is an
HP microwave signal generator that has a port for connecting to an external
terminal for running diagnostics (the front-panel user interface is not up
to the task of running diagnostics).

Don't give up hope!!

To ALL whom have helped me so far...
TNX, but I still have ONE other concern....

I am still between buying a MOTORLA MITREK UHF and modifying it for
9600 packet, and getting crystals....These
would be 25 watt units...
The DR4-10 is only 10 watts, but has SUCH a fast turnaround, and
is ready for 19.2k if needed.....The 4-10 would run me
about 100 dollars more....

ANY comments?!? I will be moving a fair distance
from the LAN this fall as I go to college... I will probably

be at least an hour drive from the closest node, so if I DO
buy the 4-10 I will eventually have to add an amplifier....
but still, it won't be THAT expensive.....

I want the best price/performance I can get...while still
doing the best job I can....The others in the LAN will
be using motorola MITREKS and TAPR 9600 baud modems...

TNX,
Chris

>all TCP/IP (no NETROM
>'s either).

  I can understand the desire to create a low-level keyboard to keyboard
channel, but why do people believe TCP/IP must be segregated to a channel
all by itself?

  Sure, FTP can consume a channel, but the same is true if someone
downloads a large file using AX.25. Sure, the IP headers print garbage
on some screens when monitoring the channel, but so does NET/ROM, and this
is a truly petty complaint anyway. What is the beef otherwise?

In Georgia, we have the ROSE network on 145.05 MHz. It is strictly a
keyboarder's medium with no BBS forwarding allowed. Frankly this is
more from necessity than choice since it collapses if a couple of
BBS stations try to use it. This system is totally separate from
the normal state high speed network where all types of activity
are welcome.

With HP's current rebate offer in hand, I rushed out and bought one of
these little jewels day before yesterday. Besides being very usable
with it's built in applications, the ability to run normal DOS programs
is welcome. I've got a copy of Jay's NOS and plan to install it over
the weekend. About a half a dozen local packeteers who meet for lunch
every Wednesday carry HP95s. Maybe we'll all aim them at the napkin
dispenser next week and see if we can talk. :-)

Lee,

As a founding member of NEPRA (which started the whole 5.01 mess), the decision
was made to put digipeaters in the repeater sub-bands, since there were no
regulations saying if a digipeater was an amateur station in repeater mode
or not. 144.91-145.09 was a relatively uninhabited part of the spectrum, and
was chosen because it was clear and in the repeater subband. This is a
relatively busy peice of spectrum a decade+ later... consequently any operation
in this portion of the band is going to be subject to NET/WRONG, IP, PBBS,
DIGIPEATER operation sooner or later. To expect this area to be kept free
for TTY PACKET QSOs is probably unrealistic. However, the spectrum from
145.51-145.79 is relatively uninhabited in most areas of the country (don't
use 145.55) and has been used for keyboard-to-keyboard operations quite
successfully by a number of amateurs... why not find a frequency in this
range which is not used in SNH and set it up as a simplex and non-bbs "channel"
....

But if a packet transmitter and a voice transmitter both key up at the
same time, neither PL decoder will see anything useful. How do you
intend to deal with this type of collision? The only thing I can
think of would be separate receivers on opposite splits for voice and
packet....

>or not... :-(

OK, so stations under automatic control must examine each packet before retransmitting it to make sure it's doesn't contain 3rd party traffic, doesn't further someones business affairs, doesn't contain obscenities, and it also has to check that third party traffic originated at a station under local or remote control, it must check to make sure there is no music being retransmitted. Don't forget voice repeaters are usually under automatic control too, so they have to delay the audio long enough to analyze it for these things.

What it boils down to is that under current rules a repeater station under automatic control (voice or packet) is responsible for what someone else (the repeater user) sends thru the repeater. This, IMHO, is where the rules need to be changed. Stations under automatic control shouldn't be responsible for content of transmissions originated by other stations. This isn't a new problem, it came up before when east coast packet BBS operaters were cited by the FCC for passing along that message with the 900 number in it.

And don't tell the FCC about Qualcomm's power control technology or they'll start citing us for running more output power than necessary. :-)

Subject: AA4RE BBS Version 2.12 Available
Message-ID: <9204031858.AA16106@ucsd.edu>
Date: 3 Apr 92 18:59:44 GMT
Sender: daemon@ucsd.edu (The Devil Himself)
Organization: UCSD Usenet Gateway
Lines: 68
NNTP-Posting-Host: ucsd.edu

AA4RE BBS version 2.12 is now available. Lots of new features to make your life as a SYSOP easier.

The biggies are:
  -- Overlay area now shared (no more task busy)
  -- Supports BPQHOST mode directly (BPQ v4+)
  -- Added REVIEW command
  -- Added command to display routing info

  -- Added authentication
  -- Added callbook support
  -- Lots of server support. W1NPR writes a great bunch of servers that
     do just about anything. Contact him for details

The software is loaded onto tomcat.gsfc.nasa.gov accessible via both
SLIP and thru the Internet. It is also at ucsd.edu in
hamradio/packet/aa4re. The filename in both cases is bb212.zip.

The primary advantage of BB over the MBL/RLI/BQE/CBBS.... systems is
the ability to handle multiple connects per port. The program uses it
own multitasker and no DesqView, DoubleDos, etc is required. On the
down side, BB has been optimized for speed and requires at least 512K
(and usually 640K) to be used productively. Only an 8088 based
machine is required. My two port system runs adequately on a PC-1
(the original 64K motherboard).

BB uses a "host-mode" interface so the only TNCs supported are the TNC-1
and TNC-2 (or clones) with the WA8DED (or clone) EPROMS installed, the
AEA PK-87, PK-88, PK-232, and the DRSI PC*PA TNC card. It also runs
with any KISS TNC using the G8BPQ PC Node switch.

If you want a diskette, you can send $5 US (or equivalent) to:

  Dave Larton, N6JQJ
  766 El Cerrito Way, #D
  Gilroy, CA 95020-4149
  (408) 847-3605

  John Anderson, N7IJI
  2729 Park Road
  Charlotte, NC 28209
  (704)-333-3249

Canadians can send 5.00 CDN to:

  A.R.E.S. Group
  Att: REBBS Update
  P.O. Box 35
  St-Jean Chrysostome,
  Quebec, Canada   G6Z 2L3

For source code, include $2 more (needs multiple diskettes). We can
handle all formats of 5 1/4 and 3 1/2 inch diskettes. Source
will also be available later via FTP after I package it.

The software can also be obtained by downloading from the following BBS:

   WA6RDH BBS -- 916-678-1535 -- 300-9600 V.32, V.42.bis, MNP
   WB3FFV BBS -- 410-625-0817 -- 1200&2400 Non-MNP
              -- 410-625-9482 -- 1200-9600 V.32, V.42bis, MNP
              -- 410-625-9663 -- 1200&2400 (MNP5), 9600 & 19200 (PEP)
   WB2COY   -- 914-485-3393 -- 1200-38400 (>2400 requires USRobotics HST)

The software can also be delivered via BITNET. Send a note to ENGE at
ALMADEN for deliver over BITNET.

73,

Roy, AA4RE

This was done in Northern Calif. at the request of the TCPIPers. It
seems that a lot of AX.25 activity would cause TCPIP to back off so
far that it was getting unusable.

We also did this in MN, just so us tcp'ers could have a quiet life, away
from the axe-grinding that some people seem to find essential to
their daily life :-(

It helped us subnet our network too..

Actually I saw some ideas on wireless office lans that had the IR transcievers
stuck above the office partitions. Downside was if someone as tall as me walked
passed 8-}. The lans were basically a ring topography.

I have one of those HP 95s and really like them. They make a great appointment
calendar, phone directory and calculator also. I was able to put antenna
formulas in the solver and figure out all sorts of dimensions. World Clock
is nice. And it will even run MSDOS programs like a satellite tracking program
on it! No if only someone would port UN*X...

A few comments have been made about using the D4-10's data slicer with the Data Engine...and one comment about it not "talking to other modems in this mode". It should be noted that the Kantronics modem when set to the 19.2K mode (and consequently driving the ttl input port on the D4-10) can easily be emulated with a RUH modem.

So in truth, the bottom line to this is that a D4-10 will only talk to another D4-10 when using the ttl input port (data slicer etc.).

I have a Paccom Tiny-2 with NB-96 modem that with a very few mods I have running at 19.2 to emulate the Kantronics 19K2/9K6 modem.

The Kantronics modem is really a simple direct copy of the RUH modem and in the 19.2 mode they simply bypass the audio stages (the wisdom of which I will not comment on) and feed the D4-10 with pure TTL data. The point of all this is that you can do the same thing to a standard RUH modem (non-Kantronics) and feed it to the D4-10 radio just as well.

If anyone is really interested, I will post an exact set of instructions needed to convert a RUH 9600 baud modem to the configuration needed to drive the D4-10 in it's "data I/O" mode at 19.2Kbaud.

 Sb: FX-146 Packet Mod

Anyone experiencing low audio levels on transmit when in packet mode and
using the rear 5-pin DIN connector may find this mod useful. It worked for me.

C65 which connects the AFSK input from the TNC to the mic line has the
standard value, .01uf. In my case this caused severe attenuation of the AFSK
signal to the point where I was unable to connect to anything. Replacing C65
with a 0.1uf cap cured the problem.

>far that it was getting unusable.

Actually, it's not the different protocols, it's the different
congestion control algorithms in the various implementations. Most
AX.25 implementations do not perform exponential backoff, and this
makes them highly vulnerable to congestion collapse on a loaded
channel.

Both my TCP and AX.25/LAPB implementations perform binary exponential
backoff, and as long as *everybody* on a channel uses them things are
much more stable. But if you have some stations that do backoff and
some that don't, those that don't will end up stealing most of the
channel.

So a much better criteria for segregating traffic would be based on
the channel access method, not the higher level protocols or
applications in use.

Phil

Me, neither.

We have here apples and orangutans.

The data slicer built into the D-410 provides no scrambling; the k9ng,
g3ruh, and TAPR modems do; ergo you can't use the D-410 _without_ a
modem and be compatible with those _using_ one of the afore-mentioned
modems.

The D-410, when used with a k9ng/g3ruh/TAPR modem will work just fine
and be compatible with others using these modems.

I am looking for a copy of WNOS, a TCP-IP ham radio program for windows.

If anyone can send me the program or assist me in getting it I would
be greatly appreciated.

Thank You

My previous message to cut off for some reason, so here it is again :-(

I have read the discussion on this topic with interest.
Now that it seems to have died down a bit, i am wondering if
there was a concensus on anything ?
I for one would like to agree on some X- header to indicate BID,
so that we could forward some bulletins over Internet to gateway-systems
that can handle those headers appropriately, and pump them into the network
locally with proper bid. This would relieve the HF network and speedup delivery
(stuff like amsat buls with shuttle parameters comes to mind :-)

I'd implement it in my version of NOS, if we agree on something
How about 'X-BID: '

Hi Aaron. Sure. I've got it (haven't figured it out yet!).
I'd be happy to send you a copy of WNOS. Send me a disk
(any IBM compatible) and a self addressed, stamped
mailer and I'll dump it on there for you and any thing
else I have sitting around to fill up the disk. Here's
address: Ken Hopkins WA9WCP, 231 Victoria Lane,
Elk Grove, IL. 60007.
Hope that helps.
Ken WA9WCP @ WA9ZMR.IL.USA or tcp/ip wa9wcp@wa9aek.ampr.org.

Hi
First I want to thank everyone who replied to my quest to find
WNOS. As I quickly found out WNOS is not a Microsoft Windows
program. What I would like to know is weather a Microsoft Windows
NOS program exists. I think one may since QST mentioned that
on page 92 of the March 1992 issue that a NOS for Microsoft
Windows has recently arrived. If such a program exists I would
be very intrested and would like to aquire a copy.
I would appreciate any information on this subject.

Thank you.

 Sean
   See the last two proceedings from the ARRL Computer Networking
Conference for information about CLOVER I and CLOVER II. They have
other HF packet information as well and I think are necessary reading
for any paper on the topic, at least in the amateur world. I'm told
that a phone call to the ARRL bookstore and a charge card can get them
on their way to you but I haven't tried getting them that way.

The best thing to do would be a real REGENERATOR. The box would detect data coming in, start to key the transmitter, and collect bits until the

transmitter is ready to send data. Then the prescribed number of sync bits
would be sent, followed by the flags followed by the data thus collected
followed by the prescribed number of flags at the end. If there is still a
data carrier present on the input, the transmitter is kept keyed, otherwise
the transmitter would unkey. The controversy is whether to have a long tail
or a short tail. I favor the short tail. Might as well save power. If the
box is going to be utilized, the transmitter will be on most of the time
anyway. The tail will have to be determined empirically, according to
population.

If you wanted to make a repeater do both voice and packet, it could
check for a CTCSS tone present to invoke voice mode, otherwise it would
check for the data stream as Kurt suggests.

If you want to get a little more sophisticated, it could look for a

specific callsign/address to indicate whether or not it was something
that should be repeated or not (however it would be decided). Slick
software could detect that it is routed via that repeater, and on
retransmission, strip off that address, and put on a new valid CRC,
AND do this by getting the transmitter started as soon as the fact that
the packet is to be repeated is known, rather than waiting for the whole
packet to be recieved as in the usual store and forward case. It could
also listen on output for potential collision and fall back to store and
forward in that case or otherwise delay as long as needed.

Does anyone ever write slick software anymore?

Why did W0RLI abandon CBBS? Does his new mailbox program
(MB11..ARC) include source code? What language is it
written in?
Thanks

    Hi Folks,

    This seems to be almost an FAQ so let's repeat it.....

    WNOS (a KA9Q NOS variant by DB3FL and others) is *NOT*
    designed for MS-Windows.

    The "W" stands for WAMPES which in turn stands for

    "Wuertemberg AMateur Packet Experimental System"

    a German unix based packet radio system from which WNOS
    derives it's auto-routing AX.25 front-end.

    The "W" does not stand for Windows (of any description).
    WNOS runs with DOS, just like vanilla KA9Q NOS.

    Having got that off my chest, I can now tell you that wnos
    is available for anonymous FTP from ucsd.edu in directory
    hamradio/packet/tcpip/wnos.

    73. Mike (G6DHU)

>I'm surprised no-one has suggested this : is it any good in practice ?

This has several theoretical advantages, but they aren't noticable in
practice with 1200 baud signals. At higher baudrates, regenerating the
bits and resyncing the clocks should be valuable. Passing the audio
straight thru avoids the extra clock/databit jitter introduced by just
using two back to back modem chips. Using back to back modems is worse
than straight thru audio. But at high baudrates where the jitter starts
to become a major proportion of the bit, a system that demodulates *and*
resyncs the clock becomes a win.

At high speeds, the one bit delay of a regenerator is minor compared to
the extra TxD required to obtain DCD lock on an audio duplex repeater.
This is the major disadvantage of audio repeaters that key up on DCD.
It takes a few flags to lock the DCD and you have to add extra flags
to your transmission because the early flags don't get retransmitted.

>At the opposite extreme, perhaps it would be worth repeating the signal
>without ever demodulating either the data or the audio : regard the
>repeater as a transverter with a very small shift.
>I suppose voice repeaters don't do this as they need to do some audio
>processing (tone decode on receive, ident on transmit, etc) but it
>might be OK for a data repeater.

Such a linear translator has advantages and disadvantages. The most
notable advantage is that no extra flags are required for keyup
delay. The most notable disadvantages are noise floor buildup and
problems with off frequency users. A traditional repeater will give
a bit of AFC action and will also give a bit of deviation leveling,
a translator doesn't. Also, at the high RF sites where most repeaters
are run, the spurious crud from other transmitters isn't continously
retransmitted with a DCD keyed repeater, but is with a translator.

It should be noted that audio repeaters and translators can handle
multiple speeds on the same channel while a regenerating repeater
requires a specific modem pair for each speed. Mixing speeds on
the same channel usually isn't a good practice, but when only
one repeater is affordable, allowing it to handle multiple speeds
gives more latitude to experimenters.

Why? The idea is that everybody listens on the output of the repeater.
If there is something coming out of the repeater, you don't transmit on the
input. On-the-fly address scanning would be useful only if there were to be
routing needs. The original packet must needs be repeated to avoid collisions
especially those induced by the "hidden-transmitter syndrome". Very simple.
No mods to the original packet needed.

|> Does anyone ever write slick software anymore?

Slick software is only slick if it's needful, useful, and doesn't break.

   I would not recommend sharing a duplex repeater with voice users;
they'll just complain until the data users are evicted.

>If you want to get a little more sophisticated, it could look for a
>specific callsign/address to indicate whether or not it was something
>that should be repeated or not (however it would be decided). Slick

  Huh? Remember that the ideal duplex packet repeater simply makes all
transmitters visible to all receivers in real time. Ideally, there is
no delay, and the duplex repeater does not care what the content of the
data is. Duplex data repeaters are not routers, they simply serve to
make all users of the repeater visible to all other users of the repeater,
eliminating the need for digipeating *between users of the data repeater*,
and eliminating the hidden transmitter syndrome. They simply don't worry
about the data content. Repeaters establish high reliability user
areas. They don't route. A linear translator, like a ham satellite,
makes an ideal data repeater.

>Does anyone ever write slick software anymore?

  Yes, but not to solve hardware problems or to solve non-problems.

Valid reason for NOT WANTING to do it.

If the CTCSS is carried out by the repeater in voice mode, modern radios
can open for voice using a tone squelch system. If course not everyone
has this ability, meaning you do not want to do this on a repeater a lot
of people expect to use for voice.

Voice users, not hearing the digital, might accidentally key up on it, too.
So it would really only be useful as a backup capability.

>Why? The idea is that everybody listens on the output of the repeater.

>No mods to the original packet needed.

There might be something transmitting on the repeater output that is in range
of the repeater but not in range of the station consider a transmission through
that repeater.

There might be more than one such repeater set up on the same pair, within
range of the using station. This would be a way to select which repeater the
packet is to go through. Such a setup would be a problem, of course, unless
such capability were present.

>|> Does anyone ever write slick software anymore?
>
>Slick software is only slick if it's needful, useful, and doesn't break.

The first 2 tend to be subjective, but that last one is the big catch.
So much software out there breaks these days. But considering most of
the commercial software is actually developed under pressure to "get it
out the door ASAP" things like good testing and even good design are
left behind. The best software tools in the world can't help when the
development attitude doesn't allow for quality.

Okay, here it goes.
WNOS is NOT Window's NOS. It is Wampes NOS, distributed by some
German hams. It is targeted at use in the European Flexnet networking
system, and is simply derived from the KA9Q sources (and lots of stuff
has been added) For those interested, it is on ucsd.edu in
hamradio/packet/tcpip/wnos

As far as porting NOS to Window's goes; go ahead and give it a try.
We had looong discussions in the tcp-group about this, and noone
is really up to. Because of the internals of NOS, this is a MAJOR task...

Hi Folks,

I have a chance of getting one of these rigs for use as the RF side of a
packet node. It's a 70cms mobile, 35 or 5W out with the usual features.

I was wondering if anyone has used such a box on packet (1200bps)
and whether there is any information on its suitability for
conversion to 9600bps.

Your experiences, suggestions and any other info would be

appreciated.

TIA & 73, Mike (G6DHU)

That's why, as all repeaters should be, you would need coordination. You still
want to regenerate locally, so as to prevent collisions from the primary
service area. Of course, what would REALLY be neat would be a voting
regenerator! One humongous big-smoke transmitter in the middle, spoke
receivers with high-speed links back to the transmitter. But then, the
transmitter would probably be keyed up continuously, due to the large number
of users. Oh well, another reason for CELLnet....

Tell me about it. I used to work for a mini company doing software support.
However, there was some stuff that came out solid and stayed that way. But
then, there were others that came out solid and got broke when the
"improvements" came out. And then there were the ca-ca products from birth.
There ain't no craftsmanship no more.....

But there's no reason why a data repeater couldn't be a router. You'd
have some complexity as regards timing/priority, but it'd be no big deal.

I'm not sure that a LT would be IDEAL data repeater.... Repeater, possibly,
but not a regenerator. The circuitry needful for a regenerator would be
well worth the effort/cost. An RF guru said that packet folks don't know
s**t about RF, and RF folks don't know s**t about packet. In large, this is
true. That's why, for every 5 packet stations, no two will be generating
the same RF/data characteristics. A regenerator would give the users a
"standard" datastream.

Clover - now Clover II is being jointly developed by the inventor, Ray Petit
(W7GHM) and HAL Communications Corp. Ray does all the real developing
and HAL does the marketing and testing & other support. Bill Henry,
president of HAL & also a ham, and/or Ray Petit show up at Dayton, SW ARRL
Convention at Scottsdale AZ, and the last TAPR meeting (Tucson of course)
a couple weeks ago. Clover was featured at 1990 ARRL Computer Networking
Conference and Clover II in 1991. Those are 9th & 10th ARRL conferences
respectively. You can get those refs at your library or get from ARRL.
The below addresses & phone nrs are a good starting point to get the
technical data that HAL has prepared. (I have copies of them, but suggest
you go to the source) Bill Henry said he will have Clover II on the
ham market "soon" and they will release the license to ham-dom to promote
the mode.
HAL Comm Corp: Geo W. Henry, P.O. Box 365, Urbana, IL 61801
Telephone/Fax - (217) 367-7373 / 367-1701.

Ray Petit: P.O. Box 51, Oak Harbor, WA 98277
Try HAL first (they want to move it along & get all the coverage
they can; plus they have the money for mailing, printing etc)
I see Clover's largest advantage to be not just in the higher speed to
to be attained, but in the processing gain for "disadvantaged terminals"
- low power (to reduce interference problems) and low gain antennas
(such as in apartments & homes in areas w/covenants (about everywhere now))

I'm currently using AmigaNOS version 2.8s and wondered if someone could
provide some information on how the serial port handler handles a couple of
items.

I just got a serial expansion and have two additional serial ports now.
For numerous reasons I must attach the TNC to one of the expansion ports
and not the one built into the Amiga. My questions are in regard to the
"ring buffer" and "maximum transmission unit" parameters. With my
nos-startup file set with these parameters to 2000 and 512 respectively
everything works fine with the built-in port but not with the external
one. I played (played is the right word since I had no guide to follow)
I found that it works with the parameters set to 1 and 1. Obviously
this can't be the optimum setting. My question is, are these internal
buffers that AmigaNOS uses or are they dependant on the hardware and the
driver software. The driver software supposedly acts just like the
standard serial.device driver and there is no hardware buffer. If
someone could provide info on how each of these parameters is used (for
both transmit and receive) it would be appreciated.

The docs don't go into much detail (big surprise). I'd rather go about
this logically rather than trial and error to find the optimum settings.

Nor would I. No repeater should have such dual USAGE... but having the
dual CAPABILITY serves for a nice backup ability, regardless of what the
primary usage is.

Apparently a few people did interpret my description as being a full blown duplex repeater. SUBJECT lines rarely change as the topic digresses, which might be the source of confusion here (combined with the fact that what I had suggested might be too abstract for some people).

You are certainly correct that these are very different things. I might be better to classify the idea I mentioned as a "fast through routing digitpeater" and start its own thread if there is any interest in it (probably not).

>>Does anyone ever write slick software anymore?
>
> Yes, but not to solve hardware problems or to solve non-problems.

Given that more and more "hardware" problems are finding solutions in software (aided by processors being faster and faster) it is no longer easy to classify a problem specifically has hardware or software. Witness modems in software that we see these days. Slick software can stretch the range of what is solvable in software as well.

What is one person's non-problem might be another's problem and visa-versa. If this were not so, I believe all problems would be well attacked when they show up since everyone would be experiencing every problem.

The new TAPR 9600 bps modem (replacement for the K9NG, $70) has a bit
regenerator included on the board; you add three components (one of
which is a PLD you have to buy from them :-(since they don't provide
the equations). It shoves incoming bits into a short FIFO and reclocks
them; as I recall, it's supposed to run about 8 bits behind, which is a
mighty short delay at 9600. I have one of these wonders but I haven't
got the PLD yet and so can't say how well it works.

Our current repeater uses a slightly-hacked K9NG modem as an FSK
regenerator; the primary purpose of that is to ensure proper deviation
levels at the repeater transmitter and to keep people from talking on
the repeater.

Or endarken...perhaps..

My gateway "bbs@w2xo.pgh.pa.us" will accept any "standard" packet
"send" command line as the first line of text. ST messages for
the NTS system will work just fine.

What I *don't* know is the latest way of addressing traffic. It used
to be that if you wanted to send to the NTS system in some state, let's
say Ohio for example, you would mail to "NTS@NTSOH" .

So, subject to recent changes in that kind of addressing, what a person
would want to do is:

1. Mail to "bbs@w2xo.pgh.pa.us"
2. Type the "Subject:" in as you normally would.
3. Enter the "send" command as the first line of text.
4. Type in the message.

The first line would look like this, using the Ohio example above.

ST NTS@NTSOH

That's all there is to it, except I may have the NTS address scheme
     wrong. Help , traffic mavens and gurus!

>
Fine, but how about "from call" and "message type" ?

X-BID:
X-MsgTyp:
X-FromCall:

I still wonder if imposing a requirement for X-headers is going to
shut out folks like , say, students who can't get administrators to
change the mail systems on their machines to generate X headers.

Because of this, I will probably support both X headers and the scheme
I mentioned earlier of using "percent-style" addresses to carry this
information, ie; an "ALL@AMSAT" bulletin from W1ABC with a BID of
$orbs22_088 would be addressed:

all%amsat.#w1abc.$orbs22_088.bull@w2xo.pgh.pa.us

Traffic would be like:

nts%ntsma.#w1abc.$NTS_03459.nts@w2xo.pgh.pa.us

(Uh..Commander, divert all the warp power to the shields, QUICK!)

Jim, thanks for posting the info about how to forward NTS traffic Internet to packet. To answer your question about the current format for addressing NTS traffic, you have it half-right. NTS traffic is addressed to the US Postal Zipcode of the addressee @ NTS** where "**" is the state to which the piece of traffic is to be delivered. Like so,
ST 27514 @ NTSNC < KB4LFD
Thanks again for the enlightenment.
73 de Will/KB4LFD

>buffers that AmigaNOS uses or are they dependant on the hardware and the

MTU is usually set to the largest size packet that you wish to send. Typically it is set to at least the same size as MSS plus 20 (?) bytes for overhead. If you want to play with large packet sizes you can make this very large and change your MSS to the desired packet size.

The buffer size is what NOS sets the serial port receive buffer to. Normally serial.device will pass received data to the calling program (AmigaNOS) whenever this buffer is full or the programmed EOF character is received.

In order to avoid interrupting AmigaNOS ever time a character is received, NOS makes use of the standard serial.device ability to specify an EOF character to wait for. Thus anytime a full packet is received and the serial port sees the KISS EOF character, serial.device passes a full frame to NOS.

Unfortunately the developers of many of the serial expansion boards are not making their device drivers 100% compatible with 'serial.device' and are leaving out the ability to specify EOF characters. This makes (or so I thought) them useless for use with NOS since it will now have to wait for the buffer to fill before it receives any data.

However, after seeing your message it dawned on me that by setting the buffersize to 1 you effectively force the serial device to pass each character on to NOS. Examination of the code shows that this is exactly what happens. Testing with my CMI multiport board has shown that this works just fine, it may be a little less efficient but it does work.

As to why you have to set MTU to 1, I don't know. On my system the value of MTU has no effect on how well the serial port works. I am currently running with a buffer of 1 and an MTU of 2048 and everything works fine.

Hope this helps. :-)

Reading what my fellow hams say, what I'd like to see is one nationwide
frequency with no damn BBSs on - just stations who want to talk to each
other in realtime.

...unfortunately, this appears to be a futile hope. After all,
junk mail has a much higher priority than actually communicating.

     For sending NTS mail on packet, some people seem to send it as NTS@NTSxx
where xx is he 2 letter state designator. Other places handle it as
ZIPCODE@NTSxx . Here in Michigan we use the ZIPCODE@NTSxx for traffic and
if someone out of state was to send it here, then the BBS programs will
flip it to NTSMI@ZIPCODE and we would have to just handle zipcode routing.
     There seems to nto really be a standard because many people say that

ZIPCODE@NTSxx is the standard and some people say that NTS@NTSxx with the zipcode somewhere in the title or text is the standard. I prefer that people use the zipcode in the "to" field and the state can handle the message automatically rather than Sysop's having to scan the message for a ZIPCODE to figure out where to send it.

But wait. We are going to try dual useage here shortly on a 220 repeater. As most of us currently are running PL decoders to mute a co-channel system, we think we might be able to co-exist.

The voice mode will have priority over packet. Packet will be here primarily because of the extremely poor throughput on 2 meters simplex due to crowding. Secondarily, the advantage of hi-altitude full duplex operation is obvious. We are a closed repeater system and intend to have packet available only to members normally but envision the Red Cross comming aboard occasionally.

We plan on adding a secondary PL decoder at the repeater which when it detects the "packet" PL, will add a 10 second hang-time,

place the packet repeater into carrier for 10 seconds after drop
of the packet PL and will bypass the voice channels into the
controller. This should keep the turn-around times to a minumim.

The normal PL decoder is always active and if it detects "voice
PL, it will open the audio line from the TNC and essencially
disable the "packet transmitter" til the controller hang timer
has expired.

If it works it just may respark my interest in packet...if not,
then we end up with a spare PL decoder for other clandestine
uses.

Hi all,
I recently bought and assembled a TAPR STATE machine DCD mod for my
PK-88 (so I didn't get the internal clock) I carefully assembled it and
tacked the ribbon cable leads to the appropriate IC pin pts...but
it has yet to work....
When it was installed the DCD worked as before, only with closed
squelch,
but to add to that I was getting no data across the RS-232....

ANY ideas???

If the node site is a high RF environment, I'd go with the MOTO, otherwise
the 4-10 should be OK.

I'm looking for the modifications needed to use 9600 baud packet on a
Kenwood tm321a 220mhz radio. I know it involves bypassing the voice filters
which will filter much of the packet signal. Anyone with information on this
please e-mail the inforation to me.
Thanks
Bill

I just got back from spending the afternoon at K1LT's, where we have

three complete node stacks built of DataEngines running G8BPQ and driving D4-10 radios running, going through final tweaking before becoming the new Dayton - Columbus - Cincinnati backbone. Impressions so far:

1) The DataEngine/G8BPQ combo works pretty well, with the 19.2 links on the internal ports and slower channels running polled KISS. There is an apparent bug/misdesign in the current BPQ code, though, that forces some nodes (I think the ones hanging on the polled KISS line) to be stuck with FRACK values that are far too long for high-speed use. K1LT is up on this one, not me.

2) The DataEngine is <not> good for high speed KISS operation. We (and I'm told others) have tried running NOS with them and there's something just plain wrong with the code -- lots of frames get trashed, and lots of retries. We think its a firmware and not hardware problem, as we don't see this with normal AX.25 or G8BPQ operation.

3) The D4-10 radios seem quite good. We're seeing 11 or 12 watts output, and reasonable sensitivity (about 1 uV for reasonable quieting in the wideband -- 60KHz bandwidth -- mode). Minor nits: there's no DCD LED, so you can't tell if the squelch is open unless you have a speaker hooked up, and there appears to be no way to get a signal strength reading from the all-in-one demod chip they're using. Turnaround time is very fast; we've run with as short as 6 or 7 millisecond TXD (note -- that's <milliseconds>, not 10ms TXD clicks like most TNCs use). My only real wish is that the damn things ran 25 or 30 watts; the extra power would help a lot on some of our paths.

We're running a few of the D4-10s in a moderately high RF site, and
haven't noticed any real problems (yet). The D4 front end is vastly
improved over the DVR2-2, which would hear just about anything other
than the signal you want.

Anyone know anything about the Proxim RangeLan radio modems?
Any chance of adding an amp/preamp to extend the range?
Just got a flyer from them and they have both internal and external
radio modules. The external version is rs232 in 902-928mhz spread
spectrum out. 100mw, 242kbps, 3 channels (hop rate?).
Internal is an ISA card with a tranceiver.

I have had problems with Tekk 450 radios and are looking to replace
(or repair) these things. I find that I can shut down the computer
and 2 hours later turn the computer back on and the Tekk radios
(on 440) will have drifted 4 kc or worse. I have seen them off
freq by as much as 8 kc or so after a small period of time. It seems
to be bothered by temperature changes rather severely.
I am running a 286 with a Packetwin card and a Tekk radio.
I have had thoughts about making a xtal oven with a resistor
attached to the crystals, but have not tried this.

Comments?

Also, what is available for 440 that would work well at 9600
or faster? Specifically, what are your thoughts about the
Ramsey, and Kantronics radios? Any others that would fit the bill
easily? Has anyone tried modifying commercial gear for this?
Inquiring minds want to know. :-)

Dave

(Looks like another visit to Dayton..)

Ted,

This is a feature, not a bug. You aren't notified immediately of an AX.25 connect because there are many reasons a station might connect to you, and you *really* don't want to know about all of them. For example, a station may automatically establish an AX.25 connection to you to forward IP or NETROM datagrams, and they might not even be destined for your station (i.e., you may be just relaying them on yourself).

The way to get the operator's attention is to first issue a carriage return after connecting. This tells the KA9Q system to connect the user to the mailbox system. Then the user can use the "chat" feature of the mailbox to get the operator's attention.

The carriage return is needed because in AX.25, there's no way to tell until the first data packet is received whether the incoming user wants the mailbox or will be forwarding IP or NETROM datagrams. The reason has to do with the lack of a protocol field in the AX.25 "SABM", or connect request frame; you have to wait until the first "I" or data frame to see what type of information is being sent.

>
> That could be a bad idea, depending on where the same-channel neighbors are. There's always some guy who is in the middle between both systems that uses high power. If you have packet on one system and voice on the other, at least one group will get torqued. Just be careful.

Data repeaters serve different users than do voice repeaters. A voice repeater serves promarily mobile and handheld stations while a data repeater serves primarily fixed stations. Since the fixed data station is working only the repeater it should use directional antennas. This helps cochannel problems as well as helping promote frequency re-use as a data channel.

And the link margins should be high enough that "some guy" using high power to get into another repeater won't cause a problem.

It's been nearly 10 years since I've been active in ham radio. A lot has
changed since then...among them, packet radio.

I have two questions:

1) What's the best resource to learn more about it and what's required
to participate? I bought a new ARRL Operating Manual to get caught up,
and haven't read the packet chapter yet. Is this enough to get me what
I need to know?

2) Can I send e-mail to packet addresses via Internet? If so, how?

Thanks for any responses.

Hi packeters ..

Do you have any idea what means "16G3" type of modulation ?
We are runing a packet application using "commercial type" VHF T/X
with this type of modulation. The "G" stands for "reactance modulation"
Is this type "true FM" ? Is this type suitable for high speed (eg 9600)
packet ?

A friend of mine who is quite active on packet has
noticed binaries using an ASCII encoding scheme and
possible compression appearently called 7plus. He
is familiar with Radix-95 and he says the header for
the new scheme is completely different. The only thing
he has found in all these headers is the string "7plus".
The binaries have all come from Dutch and German hams.
Do anybody out there have any knowledge of this?

I asked earlier today about the 7PLUS encoding scheme
used on packet to encode binary files into 7bit ASCII.
Here is the almost instant reply I got from Peter, DK5DC :

--------------------------- TEXT ----------------------

Date: Wed, 18 Mar 92 10:53:07 CET
From: D1PGLA@DUESVM1.VNET.IBM.COM
To: frode
Subject: 7plus

frode,
7plus is more an binary encoding scheme than a packet compression
program. It was developed over here in Germany cause lots of
binary data is transferred via the (7bit) Packet Radio Network.
7plus has a bunch of advantages compared to other encoding
utilities:
- it uses a Base 216 Encoding scheme, thus the overhead compared
  to the plain binary data is only about 7 Percent or so.
- 7plus is capable of splitting files.
- it does extended checking and is able to recover from single
  bit errors in a particular line.
- In case of erroneous transmission via multiple BBS'es, 7PLUS
  is able to generate so called ' error reports'. If those
  reports are sent to the originator, the originator is able
  to generate correction files which might be used to correct
  the failing 7plus file.
Hope that info helps a bit. I could uuencode that tool and send
the stuff via internet to you next week...
If you like, you may post the msg into the digest. I'm unable to
do that

Actually, "G" means "phase modulation"; reactance modulation is one way
but not the only way to achieve that.

That isn't "true FM". If your modem is one of those silly ones that
requires response down to DC, then this radio will not serve.

It's probably cheaper to get MSYS directly from the author. $5 for MSYS

1.13 and another $5 for MOPT 1.13 (not required). I use it at my
callsign server BBS and love it. Lots of nice features. The author:

>suggestions?

This is an old story Cheryl. There are ways to suppress computer RFI,
but the first thing you should try is to use a remote antenna on the
HT. If you can get the antenna 20 to 50 feet from the computer, the
problem may go away. If this doesn't work, move the HT to the remote
location and run shielded audio wires from the HT to the TNC. This
almost always works. Finally, you can invest in some conductive
sprays for the inside of the Mac case, complete disassembly required.
And you can put ferrite chokes on all the external cabling which
should be of the shielded type. Wrap the SCSI cable in copper foil
and ground it at both ends.

Good luck

16G3 means that the occupied bandwidth is 16 kHz (16), the modulation type
is phase modulation (G), and the modulation content is analog voice (3).
The G, rather than F, designator means that the radio may not be suitable
for 9600 baud use. It may work, but it's not guaranteed. The low frequency
response may not be able to track the near DC components of some 9600
baud modems.

Organization: Ministry of Ag. and Fish., Marine Research, Wellington, NZ.
Keywords: G1EMM, NOS, FTP

Thanks for taking the time to read this message.

My problem is this: trying to download a large (>> 150 kb) file, the
FTP client session on my machine starts off by opening the destination
file on disk. It then proceeds to accept lots of data without ever
writing it to disk until EOF.
If the file is large enough, my poor old XT will run out of memory,
failling to allocate screen swap RAM etc, until it finally hangs.

Question: is there a way to force NOS to flush the buffers to disk at
regular intervals? Increasing RAM may work, but does not really solve
the problem.

PC : XT clone, 9 MHz, 512 kb RAM (424 kb free after OS etc. loaded)
     DRDOS 6.0, 20 Mb hard disk SSTORed to 40 Mb.
NOS: G1EMM V1.4

Any suggestions appreciated. Cheers, Bert.

I think you're going to get a flood of suggestions on this.
To start, it would be good to figure out exactly where the radiation
is coming from. Try unplugging first the monitor (at the computer) to
determine if it's the video cable--a likely suspect. If it is, a
choke can help eliminate the problem. If possible, unplug the hard
drive and see if it goes away. If it does, a choke on that cable
might help. Sometimes reorienting the cables at right angles to each
other can help.
Does the squelch open on the HT across its entire frequency range?
Are you able to squelch out the RFI at some frequencies? An external
antenna will give you improved radio performance and probably mitigate
the RFI problem.

Congratulations on your new license.

This is all good, except that it poses the problem of
users who may not have access to a mailer that will generate
X-headers being "locked out" of the system.

I guess the question is whether we want to remain with the present
system at all. How about just assigning a real top-level domain
name for packet bbses, as "ampr.org" is for tcp/ip amateurs? Then
we could treat the rest of the address any way we wanted within
the domain.

I have the inverse problem. On HF (mostly Amtor) the rf from the rig trashes the keyboard. I mostly cleared this up on the computer in the shack by covering the table everything sits on with aluminum foil tied to the ground system. I then wrapped the keyboard cord and all the keyboard except the pad in foil and taped it all to the foil on the table. The cord also has two ferrite toroids on it, left over from a previous attempt. I now only have problems if I place my hands over the keypad without resting my wrists on the foil. The keyboard to another computer 30 feet away still goes nuts, but I haven't foiled it yet.

Exactly! There is nothing stopping us from running SMTP over AX.25
as well as TCP. If we adopt RFC821/822 e-mail, all the problems of
gatewaying to/from the rest of the world go away.

Is any of the current AX.25 BBS software available in source form?
I would really like to convert one of them over to SMTP mail as a
proof of concept.

In the Los Angeles area, we have 2 such beasties, one using a very
long hangtime (n6gpp/r, 146.745 -600); the other using none (wb6ymh,
145.36 -600, Palos Verdes). Both run at 1200 baud; wb6ymh also runs
9600 baud on the same channel.

Even though the frequency is quite busy, throughput is virtually
always great. Hidden nodes are a thing of the past; collisions are
quite minimal, and could be improved if everyone would set params to
reasonable settings - we have a few "oinkers" who think that they're
more important than anyone else. We're even able to have tcp/ip
peacefully and successfully coexisting with ax.25 stations on a very
busy PBBS/file server channel.

The n6gpp/r machine is being relocated to (I think) Saddle Peak in the
Malibu Hills, and is currently out of service.

Maybe you should check out wg7j's version of ka9q NOS. He says he
is running it as a "full service" bbs. It's version 1.00, and
you can ftp it from wg7j.ece.orst.edu. I think you may be able
to do at least some of the things you have in mind with it.

I had the same problem with Digital VT220 terminal.

This marvel of a terminal not only has signal ground internally connected to
frame ground, but also uses unshielded phone cord as the keyboard cable,
going directly into some TTL line buffers, with *no* bypass capacitors or
chokes whatsoever. 5-10W of HF RF would make the terminal freeze up.

Toroids and bypass capacitors on all cables (including power and serial) made
it work 50% of the time at 100W, but it was still pretty dreadful.

Since then I've obtained an HDS 200 terminal, which *comes* with toroids in
the keyboard cord and doesn't even flinch at 100W.

> John WA9FCH (McHarry@mitre.org)

PS: I once had some problems with a VT220 connected by a serial line to a computer in another building that was on separate ground. I explained the situation to Digital. They send me back a snotty sounding letter saying it was my fault for not grounding the serial line shield at both ends. In other words, they told me to deliberately create a hazardous ground loop, even though their misdesigned terminals do so already thanks to a common signal/frame ground. Arrgh.

Yes, it's prossible to do this, but the 7910 is not particularly well suited to this service. Ideally you want to run open squelch on the repeater receiver and use DCD to key the repeater transmitter. The 7910 is not a happy camper with open squelch. If you add a TAPR DCD state machine board, it should work ok. We've found that regeneration isn't much of an improvement. Generally if the repeater can decode it, user's can decode the repeated output without regeneration. Using a DCD state machine for squelch is a big help though, it discourages voice users and other sources of kerchunking.

>   b) Leave the box intact, but write new firmware that would in essence

>   merely take the input from one channel and re-transmit it on the

You *really* don't want to do this. You add back the packet delay that
you removed by going to a duplex repeater and you lose all the
hidden terminal protection you gained with the duplex repeater. You'd
be better off going back to simplex and saving a channel.

5.05 is NOT the latest. The latest version as of this week is 6.03. Version
6.xx incorporates upper/lower case and, if you have the latest proms in your
HAL or PK232, full ASCII printables. I will try to get it uploaded to an FTP
site, and will post Vic's landline BBS number (I did that once before). It is
also available off Compuserve. Maybe a Compuserve user can post how to get it
there.

Instead of sending flags, you could send 1/0 transitions. The state
machine PLL on the far end might lock up faster, although it's not quite
kosher.

I am becoming intrigued by this full-duplex packet repeater idea.
Now I have a question.

I have a DR-200. Basicly it consists of a Z80, SIO, and 2 7910's.

Is it practical to:
    a) Remove the SIO and connect the 2 7910's together directly adding
         the necessary squelch/PTT interface to make this a basicly Analog
          regenerative repeater.

    b) Leave the box intact, but write new firmware that would in essence
         merely take the input from one channel and re-transmit it on the
          other channel, making this a digital regenerative repeater.

    c) Is there some third option that I have missed??

I am familiar with the idea of just using voice repeater technology, but I think
there is a possibility of a much more elegant solution. And I do have a pair of
these boxes just gathering dust at this point.

  This would work, but is overkill. One 7910 is enough.

>   b) Leave the box intact, but write new firmware that would in essence
>   merely take the input from one channel and re-transmit it on the
>   other channel, making this a digital regenerative repeater.

  For a duplex packet repeater to be effective, it must repeat the

incoming bit stream with minimum delay.

>
>   c) Is there some third option that I have missed??
>

   Yes. Take a 7910 and connect the demodulator output the modulator input. I'd suggest using a combination of fast noise based squelch on the receiver and coherent data detect on the output of the demodulator to control PTT according to the following logic:

```
WHILE TRUE DO
     IF Receiver_Squelch is Active THEN
          IF Coherent_DCD is True THEN
               Enable_Received_Data to Transmitter
          ELSE
               Send_Idle_Flags to Transmitter
          ENDIF
     ENDIF
END
```

  This way, stations won't stupidly send data that could be destroyed by a non-data interfering signal at the repeater input

>I am familiar with the idea of just using voice repeater technology, but
>I think there is a possibility of a much more elegant solution.

  I've heard this said several times, but rarely ever seen anything more elegant. I'm not sure why a voice repeater style duplex machine is supposed to inelegant, anyway. Please explain....

>   - Brian

Note that to do this with an HDLC chip you actually need to send a
stream of 0 bits, since these are encoded by NRZI to continuous 1/0
transitions on the line. Unfortunately there seems to be no easy way
to program an 8530 chip to do this automatically between frames - it
can send either continuous flags or ones. One way might be to
reprogram the chip into Mark Idle and FM0 (Manchester) mode for the
preamble, since 1's encoded in FM0 are an alternating 1/0 sequence on
the line at the bit rate. Then you switch to Flag Idle and NRZI and
begin the frame.

As for kosherness, it should be okay as long as the receiver software
is defensively written. A flag (either deliberately sent or generated
fortuitously when the receiver squelch first opens) followed by
encoded zeros will look like a valid frame until the arrival of the
flag that starts the actual data frame. This will cause the "frame" of
zeros to be discarded with a CRC error, but if the preamble is very
long the receiver may overflow its buffer. This is something that any
decent HDLC driver should be checking anyway -- consider two frames
with a mangled flag between them.

Ideally the demodulator should clamp receive data at 1 (marking) when
the squelch is close and release it only when incoming data is stable.
This will cause an HDLC abort and the HDLC chip will begin looking for
a flag, ignoring anything (such as a preamble) ahead of it.

Also, some DMA-driven cards and drivers may have trouble at high
speeds if there is only one flag between the all-zeros preamble and
the actual data frame due to the short time allowed for the host CPU

to service the end-of-frame interrupt.

Phil

I have been quietly searching for a good affordable radio for 9600 baud packet. There is currently the Tek radio. It costs about $150 and leaves much to be desired. Kantronics has a radio, that does OK but the RX performs poorly in the madding RF environment of Greater Disneyland.

The Riverside Fire dept runs 9600 baud packet. They also finance some amateur nodes under the bogus "public service" banner - Your tax dollars at work.

So I ended up talking to Mike Burton, N6KZB of Riverside Fire Brigade about what radios to use. He said he had been using some Kenwood models - the TK-710 and TK-810. But of course, these have since been discontinued and replaced with "improved" models with scanning and more LEDs. Yes, of course the price has gone up.

He said his radio of choice is now the Yeasu Vertex line. They have models with 4 channels and 24 channels. These radios are true FM, 40 Watts and are available for low band and high band VHF as well as UHF (6M, 2M, & 450 in hamspeak).

So I called his supplier who told me the following: He would sell me the radios for $449 for the 4 channel model and $509 for the 24 channel model. He would supply the radio programmed to my choice of freqs. Well silly me, I asked if I could reprogram them, was it just a PROM change etc. He then claimed that the programming info was Yaesu prorietary and he couldn't give it to me, but would be happy to do it for it for $50.

This is crap. This is like a car dealer saying they won't let me have service info, that only the dealership can change the spark plugs.

So, does anyone have the programming info?

Does anyone have or know where I can get service docs?

Anyone know anywhere else I can buy these radios?

Looking for advice on interfacing 9600 baud (K9NG/G3RUH) modems to a VHF GE Master II running as a full-duplex repeater. The manual implies that the exciter actually uses phase modulation instead of frequency modulation. Will I have to make a varactor modulator and attach it in parallel with the crystal in the oscillator module? Does anyone have a working circuit that I could copy? Are the receiver/transmitter bandwidths wide enough to handle 9600 BAUD?

And finally a more generic question: can anybody suggest sources for 2-meter duplexers at a reasonable price? There is a possibility the duplexors may be exposed to a relatively high-humidity environment.

Just use the Channel Guard input for your modulation. Works great, costs
little. The receiver passband is a little on the tight side, but it'll
work.

Join your repeater coordination group. If they publish a newsletter or
magazine like SERA does, there will be a source for contacts who have
duplexers for sale, or know where to find them.

I've been using a VT220 on VHF packet without problems. Not much RFI. But
my radio's antenna is on the roof about 20 feet overhead. Also use this
terminal to read NetNews at home (using it as I type this).

Anyone written a packet driver for a NeXT box? If not I'm going to,
and could use a little direction. Since I want to use an RS232 port
for the physical connection to the modem, should I modify a SLIP
intermface (to work with AX.25)?

Just passed the exams, and am making plans (budget). Ideally, I would
like to NOT have to explicitly indicate a radio device. Rather, I'd
like to run commands normally, and use a radio domain name like:

ftp machine1.amrd.org

BTW I like what read earlier about an ametuer radio domain name;
that's
a CLEAN way to keep everyone happy.

Whilst taking Gary's point that a simple audio repeater seems to be
just as effective, I'd expect that the best performance would be
obtained by demodulating the data and reclocking it. This would add
only a single bit delay to the signal, but would reduce the jitter
and distortion caused by passing through an extra pair of radios.
I'm surprised no-one has suggested this : is it any good in practice ?

At the opposite extreme, perhaps it would be worth repeating the signal
without ever demodulating either the data or the audio : regard the
repeater as a transverter with a very small shift.
I suppose voice repeaters don't do this as they need to do some audio
processing (tone decode on receive, ident on transmit, etc) but it
might be OK for a data repeater.

Tom, I am not sure whether or not the existing Internet<>Packet gateways are
currently configured to handle NTS Traffic (Maybe Jim/W2XO can enlighten us).
In any event to send a piece of NTS traffic via packet, you need to locate
a consenting amateur (like myself) who will take your message, put it into NTS
format, and place in on a full-service AX.25 BBS for forwarding. If you would
like me to send a piece of traffic to your friend, please send me the
following information:
1. Your friend's name and call (I assume his HomeBBS is K1MEA.MA.USA.NOAM).
2. His address, including his zip code, as the packet network uses postal'
zipcodes for forwarding.
3. A local phone number
4. A message of about 25 words (no more than 30). Be sure to end sentences with
"X" (X-ray) instead of a period. Each "X" counts as a word.

Depending on whether or not your friend operates packet you may be able to
send a direct message to him through one of the gateways. One of the fine
and generous people who operate the Internet<>Packet's gateways should
be able to provide you with the necessary information to do that. Otherwise,

I would be more than happy to handle a piece of NTS traffic to your friend.

Subject: Setting up 'conventional' TCP/IP for packet
Message-ID: <1992Mar23.182914.18948@ncsu.edu>
Summary: How do I setup a standard TCP/IP package for packet radio?
Keywords: packet, TCP/IP
Sender: news@ncsu.edu (USENET News System)
Organization: NCSU CATT Prog
Date: Mon, 23 Mar 1992 18:29:14 GMT

I am interested in using TCP/IP for working packet radio instead of the
default AX.25 that my TNC can talk by itself. My TNC does have a KISS mode,
so I should be able to do it. I am currently running TCP/IP over an ethernet
connection on the Internet. Since I already have TCP/IP software working, I
would like to be able to use my SLIP server to talk to my TNC. I know about
the ka9q/NOS package, and I know that it can handle the ethernet connection,
but since I am running OS/2 instead of D(umb)OS, I would prefer to stick with
the OS/2 TCP/IP package.

With that said, my question is: How would I go about setting-up this (or any
other 'standard') TCP/IP package to properly transmit my callsign, etc for
packet radio communication?

Another question would be: Does anyone know of an OS/2 version of ka9q/NOS?

Thanks in advance!

John

Organization: Mitel. Kanata (Ontario). Canada.
Lines: 16

I am releasing an update for the PI card software, for both the compiled-in
and packet driver versions. There was a bug in the DMA driver code which would
cause received packets to be lost under some situations. The performance
with sliding window protocols is greatly improved, and you may find that
you no longer have to run in "stop and wait" mode (ie, with tcp window = mss).

The replacement files for the compiled-in version are in PI920323.ZIP,
and the packet driver version is in PI_DVR3.ZIP. These may be found
on hydra.carleton.ca in pub/packetstuff. I have also put them on UCSD.EDU
in hamradio/packet/tcpip/incoming.

Does anyone on here know what the official difference is between the
downlink signal from UO-14 and UO-22. I remember someone on here
mentioning that they got better performance after the move to UO-22
after they widened their IF filter.

Is UO-22 using a wider deviation? Using my Hamtronics reciever I
now get very bad results on UO-14. UO-14 used to be fine. I've
tried changing the 455 KHz ceramic filter but the 10.7 MHz filter
seems to be very tight on the R451.

Has anyone have any specific information on this?

Thanks,
Bruce

Lines: 28

                         Hello readers

I have built a VE3DNL 4800 baud FSK modem and have the following problem
with it. The modulation signal doesn't have a symmetrical shape
and the level of the positive and negative depends on which signal
comes first. When a packet starts with a negative pulse, followed by
a positive pulse, there is no problem. But when a packet starts with
a positve pulse, the following negative pulse is have the size it should

be. (I use a scoop connected to the output of the modem during these measurements)

Therefor I am looking for documentation about this modem which further works okay by me. Only the number of 4k8 stations is very limited here :-(. So if you have some doc. or know how to solve this problem please mail it to me or post it here. Any format will do, but plain ASCII, latex or postscript is preferred.

If there are any requests for the scheme of this modem, which is simple to built, I am able to post it as a file which can be printed on a Epson compatible printer.

Networkers,

I lost the software to go with my MFJ-1224 which is a RTTY and morse interface. The software comes in Commadore and msdos, I need the msdos. I can do HEX converstions on this end, so I prefer to get the code via email.

As I see in the manual you want to design a 8530 scc card.
There is a nice one of PA0HZP with 2 8530 . I work with this card.
There is a 150 Kbytes file SCCPRIN5.ZIP with a lot of info about this card.
The most importand info are :
The text files are:

SCCPAPER.TXT	Description of the multi-channel IBM PC packet interface. The text has been copied from the proceedings of the 8th ARRL computer networking conference.
SCCPRINT.BOM	Componentlist of the OptoPcScc print.
COMPATBL.LST	List of received compatibility reports.
MODEM1K2.BOM	Componentlist of the 1200 bps current loop modem
MODEM4K8.BOM	Componentlist of the OptoPcScc currentloop interface for the VE3DNL 4K8 bps modem.
MODEMNUL.BOM	Component list of the OptoPcScc currentloop nullmodem.

The schematic drawings have been added in this archive as a normal file.
The drawings can be printed on an Epson compatible printer.

SCCPRINT.SCH Drawing of the schematics of the OptoPcScc print.
(This file is in uncompressed form larger than 360K)
SCCPRINT.CMP Component layout of the OptoPcScc print.
MODEM1K2.SCH Drawing of the schematic diagram of the 1K2 modem.
MODEM1K2.CMP Component layout of the 1200 bps current loop modem
INTERFA1.SCH Drawing of the schematics of the current loop interface
for the VE3DNL 4K8 bps modem and the schematics of the
null modem interface.

Eighth ARRL Amateur Radio Computer Networking Conference

A multichannel IBMPC packet interface

Abstract

This paper describes a universal medium speed packet interface for the Isa (IBMPC) bus. The system consists of one or more 4 channel Isa bus boards and external modems. Multiple boards can be interconnected to form one single interface with a single interrupt vector and daisy chain interrupt priority logic.
General software can be used. There are no special initialization actions required.
The connections between the Isa bus boards and the external modems are opto isolated.

Also as some one note in tcp/ip digest at Internet it may be posssible to run TCP/IP over a BAYCOM modem. TCP/IP includes a general interface for this. It also possible to write an MBBIOS or BPQ host mode compatible interface so it will be possible to run TCP/IP (not only) using NODEDRV4 of BPQ.
Here are some info for the Packet Driver that included in TCP/IP.

The KA9Q TCP/IP package includes a driver that allows use of any network interface(that is provided with a "packet driver" that(is compatible with the "PC/TCP Version 1.08 Packet Driver Specification", by FTP Software,(Inc. The great benefit of the(packet driver spec is that it allows a manufacturer of a(PC networking interface((an Ethernet(card, etc), to(write one driver that can be loaded for(use with a variety of networking(applications, including(the KA9Q package.

For the benefit of(potential packet driver(authors, a copy(of the(spec is(included here. A prolific packet driver author is Russ Nelson, who may be reached as nelson@sun.soe.clarkson.edu on the Internet. Many of the drivers in use with the KA9Q package have been written or are(being maintained(by Russ.

This section is derived from a public domain document created by FTP

Software,(Inc. FTP Software is gratefully acknowledged for(both developing(the spec, and allowing use of their specification here.

(FTP Software,(Inc.
(P.O. Box 150
(Kendall Sq. Branch
(Boston, MA 02142
((617)(868-4878
I have no info about the interface between the L2 and SCC.
It is a good idea to be public.
  I have also the PMP11 version of Purs Man Packet with source code if you want it.
  As a lot of people has access to Internet it is a good idea to define an Internet HOST which will contain the most current version of BAYCOM.
Please reply direct !!!

KI6QE de G3RUH 1992 Feb 13

Better UO-22 Decoding

-=-=-=-=-=-=-=-=-=-=-

Dave - you are right. UO-22 is less than optimum. The problem starts in the satellite which does not have a transmit spectrum extending to DC, nor even to the desirable 30 Hz. In fact it is 3db down at 100 Hz. The effect of this is to cause "droop" on short runs of 1s or 0s. It can clearly be seen on a scope. Display the eye diagram, and slow the sweep speed down so that a dozen or so bits is visible. Looked at another way, the poor LF performance introduces wobble on the trace, and this blurrs the eye. So if the receive system was so-so (say with UO-14) then it may well be very error prone from UO-22.

The cure is to make the receive system have as good an HF performance as possible, and a good LF performance. Having a good HF response ensures a good eye, and thus a better margin to cope with the LF wobble. And having a good LF response minimises and additional self noise from the RX/modem interface.

On the modem increase C25 to 1 uf. This is the RXAudio input coupling capacitor.

On an FT736R:

1. Use a CFW455B (or C or D) IF filter in the RX UNIT.

2. On the RX UNIT, remove C82. This is a little ceramic capacitor tucked in close to the grey cube marked "455D". Bend it back and forth until the legs snap off. You can reach it by removing the radio lid only. DO THIS!

When you have done these changes, TX selection 10 transmitting to an FT736R gives a virtually perfect eye. Since UO-22 also transmits selection 10, you can see the extent of the LF aberration as a blurring at the "eye" convergence point. However you should now have reliable decoding.

Other radios seem not to be as reluctant as the FT736R, probably because they have a better basic HF response. However, changing modem C25 should help.

I am evaluating the feasibilty of implementing LF equaliser to rectify the UO-22 LF problem. The perfect project for all you DSP freaks. I'm on holiday for two weeks. I expect one of you lot to have done it by the time I get back. No kidding.

/EX
-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-= Cut Here -=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=

Hope the above helps. I do not know what may of changed on UO-14, but since it went VITA, they may have changed parameters some.

>I am sure I am not the first to think of using some sort of terminal
>software with built-in compression with 1200 baud packet.

[insert Twilight Zone theme here....]

funny, to be honest, I was just thinking of this last night. I'm playing
around with a terminal program for packet, and was thinking about ways to
improve on existing terminal programs...and my modem was sitting there
staring me in the face begging to be heard (it has V.42bis compression).
I must admit, though, I was more wondering why it wasn't implemented in
the TNC as an option...then, the TNCs could negotiate compression once an
AX.25 session is established.

>Does anyone
>know of such a program via FTP. What are the legalities of use on
>the ham bands? Compression is not encription for the purpose of
>conceiling the contents of the message.

as for the legalities, I'm no lawyer, but I'd have to say I agree with you....
compression != encryption.

there is one problem, though....you'd have to make sure the program was
very good about knowing when to use compression and when not to...for
example, if the other person/bbs doesn't have it, you can't use it. also,
if you want to put the TNC in command mode, you'll need to disable
compression before sending the ^C...or the TNC won't see it. thing is,
you don't want the user to have to worry about it, or the program would
be such a pain in the neck it wouldn't be worth using. this might be one
of those things that would work best under KISS mode (which I'm not really
familiar with), but not normal mode.

actually, there's another problem....you're computer needs to be pretty
quick, or it won't keep up (assumption based on the high-speed modem side
of things --- may not apply here....I don't know).

comments? who knows....

Keywords: PA0GRI, FTP
Sender: news@hamblin.math.byu.edu (Usenet News)

Ok, I have been having problems doing an ftp to a PA0GRI. This is what I get
from every machine I have tried (same results with ls instead of dir):

(from a NeXT)
ftp> dir
200 Port command okay
150 Opening data connection for LIST /nos/public
(VERY long pause, so long it has been about 10 minutes and nothing has
happened)

(from an HP9000 running HP-UX)
ftp> dir
200 Port command okay
150 Opening data connection for LIST /nos/public
(pause of a couple minutes)
ftp: The server host does not respond. It may be overloaded.

These results are what I get (or similar) from the following FTP systems:
HP-UX on HP9000, Lan WorkPlace on PC, NeXT FTP, and NetBlazer. I have been
told (by the guy that runs the machine) that it does work for him when he
FTP's from suns, but I don't have access to a sun. The message from the HP
indicates that it might be overloaded. Well, I checked and I am the only one
using the system so that isn't the problem.

Can anyone help with this? This is the header that I get when I do an FTP to
the machine (so you can see the version number):
220 ke9yq.ampr.org FTP version 911229 (PA0GRI v2.0a) ready on Wed Mar 11
09:47:30 1992

Please, if you have any comments, send them both to me and also to the
administrator of the machine: bob@ke9yq.imsa.edu

Date: Wed, 11 Mar 1992 19:16:22 GMT
Lines: 58

  Have you been trying to find the perfect packet radio communications program
for your Macintosh computer? Well, you may have just found it. Virtuoso is a
communications program written specifically for packet radio. This means that
it has features that you as a packet radio operator need and also packs a lot
of bells and whistles to keep your packet radio communications smooth and
effortless. The current version is 1.3.

  Virtuoso is a shareware program with a price tag of only $20. It is
available on America Online, GEnie, CompuServe, and various ftp sites.

Some features implemented in Virtuoso v1.3 include:

  -Word Mode - Useful for RTTY and AMTOR.
  -A powerful scripting language to automate routine tasks.
  -Automatic execution of a script when starting and quitting.
  -Save incoming text to a disk file.
  -Send a text file from a disk.
  -Append a selection of text to the end of an existing file.
  -Print a selection of text.
  -Column counter display
  -Word find - useful for finding the last time you heard someone.
  -Spelling checker(Dictionaries Necessary). Checks the words as you type them.
  -Split screen (rx and tx) which can be adjusted easily.
  -Windows can be scrolled up to see previous text (Up to 32000 characters).
  -Full font, size, style, and justification support.
  -Supports 300 - 19200 baud.
  -Keyboard buffer window so you can type in long messages of text
     before they are sent over the air. This window supports full
     cut, copy, paste, clear, and undo like any good text editor
     does. To send the message, just hit Command-Return.
  -Use the control key (or the command key if you don't have a
     control key) to send control characters to the TNC.
  -Option to strip off line-feeds, or all control characters on
     the input before it's displayed on the screen and saved to
     disk. Control-G's can be passed through to beep your computer
     if you want.
  -Virtuoso can automatically put your TNC in KISS mode upon
     shutdown, and take it back out at startup. This is useful for
     TCP/IP'ers.

  This file has been checked for viruses with Disinfectant 2.5.1
before uploading.

  If you cannot find Virtuoso anywhere, send me some e-mail and I'll get
you a copy. I also appreciate any and all comments, suggestions, and
criticism. That's the only way I'm going to know what to fix and improve
for the next versions.

Hong-Yi and other interested,

Check out the Archie server for your FTP requirements.
Telnet to nic.sura.net login is archie
On-line help is available. The main drawback is that you must know the filename you are looking for. Archie keeps track of all available files on hundreds of anonymous FTP sites. You can have a list of the desired files mailed to you and you may evaluate that and download as you desire.
The list you get may be quite long if you ask for a popular file.

Hope this is of some help.

Michael

I have to give a talk to my local radio club on packet. To finish it off,
I would like to say a little about where packet is going. New
applications, high speed, LANs etc. Now in the UK we are quite a long way
behind the USA in terms of new applications. What I would like to know is
what is happening in the rest of the world besides the UK. 'State of the
art', stuff. DSP has just arrived here, but at L1000 ($1800) it is not going to
get very far.

Questions.

DX clusters are growing, are these only on VHF or are there HF ones too ?

How will we get around the junk (ie articles of no interest but to the
sender, or telling you not to miss a contest that has already
finished because the message took two weeks to get to the BBS) BBS
mail problem ?

How will TCP/IP influence future systems ?

Is DSP going to be affordable in the near future ? What advantages will it
bring in terms of speed, overcoming interference, spread spectrum ?

Why are some people so anti-packet (I need to get at the hecklers!), is it
because they don't understand it, own the spectrum it uses, or another
reason ?

Any help would be appreciated. I already know how I think packet will
develop, but I would like to know others views.

Mike

Try PacComm in tampa florida, sorry I don't have the phone number but
information does. They have a 'handypacket' model that is small and has
nicads built in. I am using the micropower tnc from them. You might
want to check that the model you get can run open squelch as they ship
it... the micropower needs a DCD board.

PacComm sells an Industrial/Commercial line of _very_ small TNC/modem

combinations. Ask for these specifically, and ask for the amateur
discount on the commercial line, it's definately worthwhile. I've got
a couple of the TNC/G3RUH combinations that are smaller than a pack of
cigarettes!

Tasco, the Japanese company that manufactured the Heath Pocket Packet,
was at the recent TAPR annual meeting displaying their product line.
They have about a dozen different products, including one that's very
similar to the Pocket Packet.

The good news, perhaps, is that they now have a US office. Not a lot was
said about whether they would be selling through dealers or by direct
sales, but the brochure says: For further information and details,
please contact:

     Tasco Electronics Co., Ltd.
     USA Regional Office
     22511 Aspan Street
     Lake Forest, CA 92630

Tel (714)581-5197   FAX (714)581-4941
Attention: Masa Sawada, JF2GPF

Masa was the representative from Tasco present at the TAPR meeting.

I have no affiliation, etc.

>get very far.

I doubt that you are very far behind the US in *applications*. It's hard to be *far* behind zero. This is the major problem facing packet in the US. Aside from Packetcluster DX spotting systems, and the BBS Email and bulletin systems, there are practically zero *applications* of packet radio.

We have proven high speed hardware, proven networking software, and fair connectivity in local areas, but we don't have anything to *do* with packet radio. The vast majority of users have remained at 1200 baud on simplex 2 meter channels because there isn't enough to *do* with packet to require them to upgrade to faster channels and better modulation schemes.

>Questions.
>
>How will we get around the junk (ie articles of no interest but to the

>mail problem ?

Short expires. If that doesn't work, use shorter expires. Ideally precedence fields should be implemented to indicate to the systems how to handle the message, and when and if it should be thrown on the floor.

>How will TCP/IP influence future systems ?

Because the implementation we have is totally open, it has attracted a lot of interest among the code hackers. Potentially it opens the way for unlimited applications, but as a practical matter because of the monolythic way it's implemented on DOS machines, it's turning into a complicated way to do a BBS and ship a few files. It's actually an impediment to new applications at this time. It's best use now is as a switch node in the trunk network and as a gateway to a capable multitasking system with native TCP/IP (ie a Unix box). Before TCP/IP can have a significant impact on packet, we've got to abandon DOS or rewrite the code to act as a device driver accessable to *any* program running on the system.

>Is DSP going to be affordable in the near future ? What advantages will it
>bring in terms of speed, overcoming interference, spread spectrum ?

As prices drop for DSP hardware, as most everyone expects it to do, there will be a proliferation of software modem designs available for the down-loading. That's going to obsolete the hardware multimode boxes like the KAM, PK232, MFJ1278, G3RUH daughter boards, PSK pacsat modems, etc. While it's unlikely that speeds will increase above 9600 baud using DSP in the near future, certainly more efficient and more noise and interference tolerant modem designs will be forthcoming. Because it's "only software", users will upgrade quickly. DSP probably won't have an impact on spread spectrum techniques in the near term, too much horsepower is required to

do SS in software.

>Why are some people so anti-packet (I need to get at the hecklers!), is it
>because they don't understand it, own the spectrum it uses, or another
>reason ?

Yes. :-)

There are a variety of reasons people are hostile to packet. The number one thing that I hear is "it's not *real* radio because it doesn't take any skill to use it." That comes mostly from the CW forever crowd, and a little bit from the paper tape RTTY crowd. The second most common complaint is "there's nothing to *do* with it." And the third most common complaint, not from the CW crowd, is "it's so slow."

Packet *is* the fastest growing mode in amateur radio since the advent of SSB, so there is interest in it out there. But many people quickly become disenchanted with it because it is slow and booooorrrring. We have hardware to fix the slow, but we haven't yet solved the boring.

>Any help would be appreciated. I already know how I think packet will
>develop, but I would like to know others views.

I've mostly dwelled on the problems of packet above. What I'd like to see in the future is a more fully connected network operating at a high enough speed and with proper networking software so that distributed computing can become a reality. I'd like to see multi-player, nulti-computer games. I'd like to see distributed databases so you could send a demon out into the network to run down practically any fact you might want to know. I'd like to see cooperative massively parallel systems evolve that can take a problem handed to the network and divide it up among many machines for rapid solution. That's where I would like to see packet go, but I *expect* it to fall into a 1200 baud and C64 forever mindset that never reaches the heights it is capable of scaling. I guess I'll be happy if we can just reliably deliver the mail to a mobile user outside his home LAN.

A colleague of mine, WA1FRK, is looking for hams in Italy who are
active on packet. He wishes to set something up where schoolchildren
here in the States can have some sort of pen-pal thing with
schoolchildren in Italy via packet radio (probably exchange of
messages through PBBSs).

Please reply to me and I will forward any responses to him.

During the last couple of weeks, I have noticed some discussion concerning an implementation of TCP/IP designed to run on an OS9/68000 system. When I saw that it was designed to run under OS9, my imagination started running wild. I am wondering if it would be possible to port the program to a Tandy Color Computer 3 running OS9? To that end, I have a couple of questions for the TCP/IP gurus.
1. What language is the program written in? (BASIC09, Pascal09, C, assembly)?
2. Is the source code available?
3. What type of device driver is the 68000 version designed to use?

Thanks for any comments.

One of the problems with gatewaying mail from RFC-822 style
format to "packet bbs" format is determining the "type" ie;
sb, st, sp .. etc.

It occured to me that we may have a de-facto system already
in place.. namely that no "distribution" name contains any
numerals and no call letters have *no* numerals. At least I'm
not aware of any distribution names (AMSAT,ALLUS,..whatever)
that contain any numerals.

I propose that we "cast this in stone". This could simplify life
for software authors immensely and prevent having to use
X-headers.

Admittedly this does not work for "ST", but I have seen very little
of this in the last year or so here.

For specific BIDs, the present practice of starting the first line
of text with "BID:" seems good.

The Mach 3.0 kernal is free, and is being used on 386 machines.
The GNU HURD may become a reality one day. Maybe now is the time to
switch?

I propose that we cast it in cement. We can then deposit the
whole thing at the bottom of a deep lake, where it belongs.

It's about time we abandoned this toy forwarding model we're
using and go with protocols that are already known to work: SMTP
and NNTP. There is absolutely no rule that says you can only run
them over TCP. AX.25 provides a perfectly useable reliable sequenced
transport that would make a great home for SMTP and NNTP interaction.

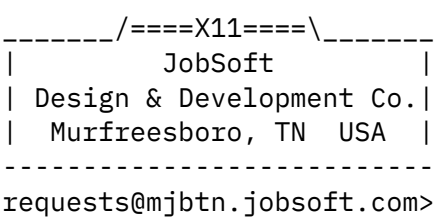
[Sorry Net: Direct Email not working here]

Michael,



All mail from listserv@knuth.mtsu.edu back to you is bouncing stating
that 'MCROWDER@RALVMB' is "not a registered gateway user." It then
says "user unknown". You may or may not have been aware of this
problem. (Aside, I think it rather stinks if this error implies that
IBM requires all email to and from the outside world to be allowed to
specially registered users only. :-|)

Anyway, please check into it and get back with me somehow. Thanks.

Again, my apologies to the net, but I could think of no other way.

Thanks and 73's,

Mark

We use numbers in the distribution lists here in Australia. @VK1 for Canberra, @VK2 for NSW, @VK3 for Victoria.

I don't think the X- headers are bad. There does need to be some standardisation however. Something like;

X-BID: $15111_VK1KCM
X-TYPE: B
X-TO: TCPIP
X-AT: SEA

There may be more we can use (if there's a need). Would something like the 4 above be sufficient or should we do something like;

X-AMPR-BID: ...
X-AMPR-TYPE: ...
etc.

Carl.

  >
```

Almost ALL of the KAM commands regarding Packet operation are "standard". About the only differences are things like "Status" instead of "CStatus". PktGold is a specific package written for the AEA Host mode, there are specific packages written to take advanage of the new (version 4 and later) Host mode in the KAM TNC. Hostmaster for example. Also, there are packages for multi-mode TNC's that are written to support all three. Lan-link by G3ZCZ is a prime example. PHS (written by the same person that developed THS for the DRSI cards) is a true multi-mode HOST package for the AEA PK-232. The major difference between it and PktGold is the $65 price. PHS is shareware. On the DCD, the KAM software is adjustable and has different settings for both the HF and VHF modes. The TAPR state machine is a fine part, but it didn't give 'true' DCD for HF operation without a. a second TAPR DCD board, and b. a lot of extra parts. Considering the added features of the 3.0 and later upgrades, the $40 for the EPROM was worth it. All that is required is some time to sit and adjust settings and take notes for comparing performance. A final note on the tuning displays. For HF packet and RTTY, the KAM display is much better than the PK-232. If you're used to a more 'traditional' cross type tuning scope, the filter output of the KAM is available, but not worth the additional effort. The 1278 has good internal and external tuning.

This always starts flame wars in the TCP Group mailing list when it comes up, so I should probably be quiet. However, this is a pet peeve of mine. While I very much appreciate all the hard work done by Phil and others to make TCP/IP available on DOS platforms, it really is a limitation on network *applications*. I'm playing with a AX25 driver for SunOS that came down the net, and that may be the solution I'm looking for, but it *does* require a Sun Workstation and most amateurs don't have one sitting on their operating bench like I do. Plus there are a lot of neat hacks in the latest versions of Phil's code that apply directly to radio packet that are missing from the Sun TCP/IP.

I'm afraid that any Unix lookalike for Intel platforms that doesn't support DOS emulation is going to meet with little acceptance among hams. The commercial packages that do are terribly expensive, more than the hardware in many cases. We really need a way for DOS applications to talk to TCP/IP other than through Desqview loopback schemes. Turning the present code into a device driver that a DOS program can treat as a character device, or maybe block device, just like any other device on the system, would immediately open up a whole range of applications for packet. Applications programmers could treat the packet network as a black box that responds like a terminal or a disk. I see lots of uses for this.

Up here in the land of the forgotten, we have some serious packet network problems. Everything presently occurs on one channel, 145.01. NET-ROM nodes, mail forwarding, three or four BBS, point-to-point chit-chat, at least two dozen personal BBS things, etc. The biggest problem is as soon as you connect to the local node and try to get into the local BBS, everybodys mail-forwarding and beacons and everything else comes alive, and you get re-tried into oblivion.

I have visited the Northwest and seen their excellent (IMHO) system where each node/BBS has its own (coordinated?) frequency. The mail-forwarding etc takes place on 220 or above, so you're basically on your own. I was definitely impressed.

Our local folks don't like this idea, but do want to set up a separate system for local use, especially for ARES/RACES type stuff. I suggested they simply put up another NET-ROM type node such as the 145.01 system, but they feel for some reason that they need a full duplex repeater.

My question to the net: Are there any real advantages/disadvantages to using a full-duplex (just like voice) repeater for packet. I know it is more expensive, uses two channels, etc., but I need more.

Please E-mail your responses as I don't often get time to read the newsgroup.

Thank you for any info.

73,
Michael

I recently put forth a proposal that packet bbses adopt a naming
standard such that personal mail could be inferred from the fact
that the recipient address contained a numeral, such as all
ham call do, and that "distribution" groups such as "AMSAT, ARRL, etc"
would contain *no* numerals.

A synopsis of the discussion so far:

To: durham@w2xo.pgh.pa.us
From: pitt!ve6mgs.ampr.org!mark (Mark G. Salyzyn, VE6MGS)
Subject: Wow
Status: R

Jim, marvelous idea ... no distribution name contains numerals, no
call letters contains no numerals. I like it. except, we
get a few distributions with numerals (9600, PNW7 ...), so I
would simply state that we use a short `legal call' algorithm
instead to weed these out. There was source for one posted about a month ago,
but a mistaken `find /usr/spool/news/rec/radio +45 -exec rm ...'
(instead of -mtime +45, I keep stuff around for 60 normally) when I
ran out of spool space today made mince meat of that idea !!! :-(

If not, I use a small call checker here that has not yet been tripped ...

Thanks for the idea, I will be changing the code today to reflect his
improvement. Your `problem' with NTS traffic ... ALL NTS traffic is
supposed to be addressed to the NTS<district> so ANY message with nts*
MUST be NTS traffic (unless, tee hee, someone decides to send a
bulletin to explain NTS operation and addresses it to NTS :-)

Ciao, 73 de VE6MGS/Mark -sk-

****

From: pitt!ve6mgs.ampr.org!mark (Mark G. Salyzyn, VE6MGS)
Subject: No numbers in personnal address on packet
Status: R

Jim, another `idea'. But this may be due to the nature of the gateway
I operate. Since our local BBS operator is overwhelmed with `just' the
normal packet operation, he is reluctant to support dropping messages
off directly in the TNC mailboxes unless they have a proven record of
being reliable. I, on the other hand, operate the gateway to allow
messages directly into mailboxes. A `popular' approach is to drop
the message off to the `person' rather than the `call'.

        SP DENNIS @ VE6PAW

as an example. The personnal mailboxes often do distinguish between
bulls and personals too. I don't think this is a problem at your
gateway (being centrally located, and used by people all across the
US), but it shoots holes in me using the number/no-number approach for
differentiating between bulletins and personal messages :-(.

Ciao, 73 de VE6MGS/Mark -sk-

****

AA4RE suggested:

>Alpha = bulletin
>alphanumeric = personal
>all numeric = NTS (at least US)

>Another NTS option is that they are all sent to
    xxxx @ NTSxxx

****

W2XO reply:

Parsing for a few exceptions wouldn't be bad.

There is perhaps a bigger problem with distribution names: How
do you tell that they are *packet* addresses? Mail comes in
from , let's say, lots of different sources/networks. Packet
mail can be parsed by inferring that it is packet mail from
".NOAM", ".AU", ".EU"... etc. Only as many cases to parse as
there are continents. There is no "H" address on a distribution name.
Should there be?

I guess one could parse for all the names.

-Jim
****

AA4RE reply:

>Well we could always make our own standard...

>   SB SALE @ ALLUS.Bulletin.ampr

>Roy

****

W2XO AGAIN:

Hurrah! I think that is may be just that simple.

The problem is really on the *RFC-822* side, not the packet bbs side.
If someone sent a bulletin from , say, the internet addressed this
way: all%allus.bulletin.ampr@w2xo.pgh.pa.us, I could easily parse it.

One nit-picky thing, I dislike "ampr" because it is too close to the
tcp/ip network name of "ampr.org". Maybe "amprbbs"

Hmmm... how about all%allus.$234567_w7kdj.amprbbs.bull@HOSTNAME

Sendmail here would immediately drop my hostname and
change the "%" to a "@", which would be:
        all@allus.$234567_w7kdj.amprbbs.bull

The mailer called by sendmail would then feed it to the packet
bbs as:
        ALL @ ALLUS < W7KDJ $234567_W7KDJ

On the "packet" side, using the "H address" field for bulletins
could work. This would eliminate having a big table of all the
distribution names (ALLUS, AMSAT..etc).

I can only speak for my software, but I assume that just moving the
H address parser higher in the parsing chain would allow the
bbs to recognize anything with ".BULL.AMPRBBS" as a bulletin, no
matter what the distribution name.

Hmmm.. if we used a scheme like including the BID in the H address
of a bulletin, it would make the BID field redundant 8-).

Am I off the deep end?

Why not just use something other than dots in the routing part of the
hierarchical address? Then there's no confusion with worldwide
standards like RFC822. It was clearly a mistake to have chosen them
in the first place; it may not be too late to change.

There really are only about five or six ham bbs packages out there; if
the days when the authors were coding to be incompatable with each other
are really over, then maybe we could all get together and begin by
getting the BBS software to treat some other character as it treats dot
now. In a subsequent release, it would begin SENDING that character.
And finally, much later on, it would stop accepting dot.

Yeah, it's a pipe dream.

The proper way for an internet-to-hambbs gateway to operate is to
use the essential part of the ham address in the internet address.

For example, mail sent from bbsland to the internet:

SP BRIAN@UCSD.EDU.INTERNET < WB6CYT $81723_WB6KDT

would wind up appearing on the internet side (assuming that my pc
workstation is the gateway host)

From: WB6CYT@WB6KDT.pcws.ucsd.edu
To: brian@ucsd.edu

Mail going the other way does this:

To: wb6cyt@wb6kdt.pcws.ucsd.edu
From: jones@no.such.agency.gov

becomes

SP WB6CYT@WB6KDT.#SOCA.CA.USA < INTERNET $AA02283_pcws.ucsd.edu

The hierarchical routing information came from a table built by hand
and added to every time mail crosses from bbsland to the internet.
The internet return address is inside the message as RFC822 type
headers, since there is no possible way to encapsulate it into the
ham addresses, which were so shortsightedly limited in length.
The 'INTERNET' becomes a flag to intelligent software (or, lacking
that, intelligent users) that the real return address is inside the
message.

At least, that's the way I'm going to do it.

 Several of our local radio club have been trying to run
ka9q with little success. There are 4 different tnc's with varing problems:

 mfj 1274 - receives but will not xmit
 mfj 1278 - receives but will not xmit
 hk-232m - initialy will not receive, but after lots of playing around
            works ok (looks like a flow control pbm)
            The hk-232m is heathkits version of the aea-232m.
 pk 88   - the mfj 1278 owner hasnt tried this one yet

 What we would like from someone that is using one (or more) of these tnc's
is:

 1. What parameters must be set on the tnc before you put it in kiss mode.
 2. What does your autoexec.net look like
 3. Anything special you do in net to get the system running
 4. What do you do to get the tnc out of kiss mode.
 5. And finally HELP :-(, we have spent a lot of hours on this with little
    progress. Any insight into our problems will be appreciated :-).

 We have all only been trying the ax25 side of the program, figuring when
that runs then we can attack the unknown (tcp/ip).
 If you can shed some light on any part of the above it would be appreciated.

There is DEFINITELY an advantage to going full-duplex!
With the typical digipeater, it hears everybody. But everybody doesn't hear everybody else, so you get collisions. this is known as the "hidden-transmitter" problem. Also, there is the delay in that the packet is received, then retransmitted. In a full-duplex system, you can put in a regenerator, so that the packet comes out pure and pristine. 8-} Also, when you regenerate in real-time, the repeater is transmitting so that other folks won't transmit while the packet is being repeated. This GREATLY reduces the "hidden-transmitter" problem. There are differing approaches to the implementation, of course. Some folks propose a long tail on the repeater, presumably to minimize the key-up time and/or save the relays. Some propose no tail at all.

First of all, Michael, you didn't give us an address for e-mail
(at least it didn't show up here), so I'll post to the List.

Personally, I think the idea of using a medium profile full-duplex
repeater (like voice repeaters) for packet would be a great idea for
covering a particular area. Whereas now (in this area at least),
BBSs are low profile (some have negative HAAT !), there is a lot of
congestion, collisons, hidden transmitters, etc. In short, throughput
is very low anytime activity is above a minimum. On top of that,
the Cincinnati area is hilly. Any medium profile digi on a busy
channel is almost useless because it hears too much.

I think the duplex operation is a good idea. I've pushed it a bit
here, but interest in building packet facilities is very low.
With a medium profile repeater, each station could hear anyone
else using the channel. Collisons would be tremendously reduced.
Also, "digipeater delays" would be avoided since the duplex
repeater would simultaneously retransmit the packet.

To me, it seems like a win-win situation in certain locations.
It might even be good for areas where there was overlap between
adjacent LANs. I think it's worth a try. Has anyone experimented
with this?

It would seem to me that it would be relatively easy to try...just
convince some civic minded repeater club to let one of their
secondary machines be used for a month or two as an experiment.

It should work excellently. If you have a router listening as well, it could
redirect packets to the appropriate area. You start to get into some rather
interesting topological problems, but they are not unsolvable....

|> It would seem to me that it would be relatively easy to try...just

That could be a bad idea, depending on where the same-channel neighbors are.
There's always some guy who is in the middle between both systems that uses
high power. If you have packet on one system and voice on the other, at least
one group will get torqued. Just be careful.

Keywords: G1EMM, NOS, FTP

Thanks for taking the time to read this message.

My problem is this: trying to download a large (>> 150 kb) file, the
FTP client session on my machine starts off by opening the destination
file on disk. It then proceeds to accept lots of data without ever
writing it to disk until EOF.
If the file is large enough, my poor old XT will run out of memory,
failling to allocate screen swap RAM etc, until it finally hangs.

Question: is there a way to force NOS to flush the buffers to disk at
regular intervals? Increasing RAM may work, but does not really solve
the problem.

PC : XT clone, 9 MHz, 512 kb RAM (424 kb free after OS etc. loaded)
     DRDOS 6.0, 20 Mb hard disk SSTORed to 40 Mb.
NOS: G1EMM V1.4

Any suggestions appreciated. Cheers, Bert.

There already exists a standard (or rather 3 or 4 of them) for the
extra fields needed in the rfc-822 style header. Let's not invent
yet another, but simply use what is already in use by various mail-
exchangers.

X-BID:
X-Message_Type:
X-BBS-BID:
X-BBS-MSG-T:

These are but a few of what I've seen. Let's pick one ... and stick
with it. Makes life simpler for the mail-exchanger authors, the bbs
authors, etc.

As far as I can tell, the only thing we need that rfc-822 does not
have is the capability of typed messages, and the "BID" concept.
Everything else can be handled with existing standards.

It is up the the mail-exchangers (that software which lives between
the "bbs world" and the "internet world") to handle the details.

The adoption of any new standard (e.g. SMTP or NNTP) simply will not
make any difference to this discussion. We HAVE a working message
distribution network, and anything we do must interoperate with it.

To recap: the problem only exists at the internetwork boundary.
It is at that point that the protocols of the different networks
must be resolved. It is desirable that the resolution take place
in some standard manner. RFC-822 provides mechanisms which can
be used for this resolution. Only minor use is required of the
RFC-822 header extension mechanisms (for message type and BID).

I'd be glad to report what my code does in the internetworking case
(import and export), except that it's been working so long (five years)
that I've forgotten the details and would have to look at the code.
The code is at home, I'm at the office.

Actually, the problem is with DOS, not NET or NOS. DOS doesn't update
its directory descriptors until a file is closed, and to do this
frequently during a FTP transfer would add a lot of overhead.

I don't see the problem here. I can ftp an 800K file with no problems at all.
Seems to
me there may have been such a problem many versions ago.

Grinch/wet blanket that I am, I'm constrained to ask you to
remind your friend that what he proposes is not only illegal -- we
don't have third party traffic agreements with Italy -- but very
likely to cause some extremely embarrassing inquiries.

There ARE ways around the U.S. amateur's inability to handle
such third party communications with Italy, but not DIRECTLY.
The rub would be to find a PBBS in a country that DOES have
third party agreements with Italy...

Here is another alternative, less costly, but not as good. I am
running Ultrix with the old NET running as a radio port server and
IP switch. It is SLIP linked through two looped rs-232 ports to
the Ultrix networking stuff. This saves the PC and the
electricity and lets you use your BSD networking code "on the air"
like Phil's scheme. It costs two serial ports, however.

This is admittedly a little kludgey, but it works and I hope to
improve things when I get some time to hack a little, like using
sockets to communicate between processes, etc. For now, it allows
stuff like using sendmail to handle mail routing between the local
network 44 splinter and the real world, including packet bbs mail.

Hi ,

I have seen postings recently regarding new versions of amiganos however
I cannot gain access to the ftp sites and was wondering if there are any
other sites carrying these versions. The last version I obtained was
2.7 from thumper.bellcore.com about a year ago but believe that this site
no longer carries the archives.

Am I correct?????

Thanks in advance.

The NETROM connect problem in AmigaNOS is now cured in v2.8s, available from ucsd.edu in the hamradio/packet/ka9q/incoming or ../amiga directory. The NETROM code was an exact copy of the PC code, but it didn't work on the Amiga.

I have had a play around with it and it now works fine.

There are three archive files on ucsd.edu :

asrc28s.lha	sources
anos28s.lha	program
akit28s.lha	most of the files/directories that you will find useful. NOT a complete kit! (you have to do something your self!)

Bye for now..

P.S. If you make any additions/modifications to the source, please let me know.

John.

I have seen the ad for the Alinco DJ-1200 Data Radio in QST for the past few
months. I have not heard anything about it. I was wondering if anyone
has any experience with it. I would appreciate any comments.
Thanks

I'm the proud new owner of a DRSI PCPA Type 1 plug in TNC, and have
a few questions:

1. Is there any way to set a separate SSID in ths for each channel in the
   configuration file (e.g. ths.cfg)? I know how to do it once ths
   has started, but I want to be able to set it up automatically.

2. Is there any good tnc emulator software for this board other than ths?
   Anything that will make it behave more like a TAPR2 clone, using
   a "cmd:" line and ASCII commands instead of a menu driven interface?

3. Is there any supplementary documentation to this board? I bought it
   used, and it came with one manual which covers the basics. It also
   doesn't cover 3 of the 4 software packages that came witht the
   board (i.e. no documentation for BB, PC-Node, and TCP/IP).

4. Anyone out there who knows the DRSI PCPA boards intimately who would be
   available to answer occasional questions from a neophyte?

Thank you...Joakim

I'm not sure it's legal for two reasons:

1. What are you remote controlling. I think the regs mention vehicles?
2. Where are you going to find type accepted equipment that's going to allow you to pass 1200 baud data?

I purchased one because it claims to have a true-FM transmitter, and when I purchased it, I intended to run 9600 baud on 2m. Unfortunately, it doesn't come with a schematic, and no one has responded to my query about locating the proper connection points to wire in a G3RUH 9600bps modem.

That aside, I have been using it with a standard 1200bps tnc and it work just fine. It appears to be just a DJ-112T w/o the mic and mounting bracket--but it may have had filters tweaked. It's not particularly fast (I still use a txdelay of 200ms) but it a good deal if you want a 2m packet-only radio cheap. You can always go back and put a mic on and use it as a spare later.

Cost wise, it beats out a ramsey kit with an external amp; but I wouldn't

be afraid to dig in a ramsey to hack it for 9600bps, while I have the
"do I want to mung my new radio?" jitters with the 1200.

Regards;
Paul

>keep parts to a minimum for this particular project.

No, you're interpreting it correctly. I just went through this with
the TAPR DSP-1 beta board. That board provides some hardware to
assist (a programmable external divider), but I wanted to see if I
could make it work with internal 85C30 stuff. Bottom line, it didn't
play for exactly the reason you state. My initial implementation only
needs to be half duplex, so I just reprogram the BRG when switching
between receive and transmit. But I know of no clever way around
the problem.

>   The second topic relates to AMTOR ... I've modified an XR2206/2211
>modem for RTTY and AMTOR. Reading the CCIRR recommendation 476 (the
>definition of AMTOR as it appears in the ARRL's 3rd Computer Networking
>Conference proceedings), I still have some questions relating to bit-
>sync'ing.

Probably the best published material I've seen on this is the July 1988 QEX article, "Algorithms and Methods for SITOR/AMTOR Systems," by Paul Newland, AD7I. I've implemented his algorithms (again on the TAPR DSP-1 board) and they work just fine.

Basically what his approach does is sample the modem output at 1-msec intervals (10 times per bit). To achieve sync, it looks for a valid AMTOR block that is stable for at least 7 msec. (A valid block consists of three 7-bit characters each meeting the 4B/3Y AMTOR error-check standard.) Once having found that, standard DPLL techniques are used for phase tracking. More detail is in the article.

        I can't say I've seen this covered in an official FAQ yet but what
is NET/ROM exactly. Locally, I believe we've been told NOT to use it by
one particular person. Is it a toally different protocol than AX.25 or is
it something run on top of AX.25?

Our club has built an YT3MV 23 cm transceiver and another one is under
construction to enable us to tie our mailbox and node together.

We received the copies of the original article from an Italian gentleman
whose email address I have unfortunately lost. However, the chapter
describing the modified TNC2 and the manchester modem is missing.

We would like to get in contact with a person who could copy the missing
pages for us. The magazine is Italian 'CQ Elletronica' (1989 or 1990, I
suppose).

I remember seeing Iztok Saje who was the primus motor in the YU high speed
backbone project to appear in the rec.radio.newsgroups, however I don't
have an email address for him. Iztok, if you see this, please try to reply,
we would very much like to consult the system with you.

I have an AEA PK232 MBX that I am considering upgrading for 2400
baud packet operation.

I have heard that AEA has a 2400 upgrade for $130 and requires
that the unit be sent back to them.

A couple of questions:

* Does the AEA mod add functionally to the unit, or does the
  2400 mode replace one of the modes?

* Is there another way (cheaper) to add 2400 baud for packet?

* Does TAPR or someone have a 2400 baud modem to connect into the
  modem header?

Thanks

Randy

Is it possible to "listen in" to packet radio data?
I'm a SWL'er but not a Ham. So can only recieve.
I would however like to monitor this type of communication.
I currently recieve morse and rtty using Hamcomm.
Your suggestions appreciated.

Can someone tell me where I can find packet BBS software, such as MSYS, via
FTP? I want to play around with it and see what all is invovled with it.
Thanks!

???????

Type acceptance under what service?? I wasn't aware of any type acceptance
(other than maybe Part 15) for amateur radio equipment.

If they can determine a better part, why not just publish a tech-note and
make it widely distributable to the ham community. Then we can make the mod
ourselves.
To be honest, this excuse doesn't really wash. Sounds like the kind of thing
I would expect to hear from Amana about their new Radar-Range. :-)

Subject: ka9q telnet

Has anybody who has downloaded the OS9/68000 ka9q package determined
how to get telnet to work in character-at-a-time mode? I can only
get it to work in line-by-line mode, which won't allow me to log into
any unix machines. I have even tried 'echo accept', but it still stays in
line-by-line mode. I can watch the lights on my modem, and nothing is sent
until I hit return. Thanks a million zillion,

Hello. I need a little help and this seems like a good place to
start. I am contemplating the purchase of an HP-95LX palmtop,
and have a couple questions:

1. I know I saw an article in some ham radio magazine or
other, but missed it, describing the connection of the HP95LX to
one of those teeny TNCs. Anybody remember where it was, and
where to write for a copy?

2. Where can I get one of those teeny TNCs? Heathkit no
longer carries the "Pocket Packet", and I can't find the ad
anymore in QST for the PacComm battery powered unit. Any
suggestions?

Thanks - email responses would be greatly appreciated, since my
time to read this newsgroup gets shorter everyday.

Has anyone experienced problems with AA4RE vers 2.1t 'freezing'
on received frames greater than 256 octets ?

A local BBS operator is has begun experiencing this problem since
a local nos node increased the mtu size on its interface to 512
in lieu of teh 256 it used prior.

He doesn't have access to news, and I'm not terribly familiar with
his configuration, but the versions of code he is using are as follows:

AA4RE vers 2.1t
BPQ   vers 4.04

He claims that 'when someone is connected, and a frame is recieved greater
than 256 bytes in length, the BBS freezes and the cursor sits in the
window of the received frame'

The 'when someone is connected' is empirical.

Any help much appreciated.

Thanks
Terry

clemon@lemsys.UUCP (Craig Lemon VE3XCL) writes:
>what is NET/ROM exactly?

More than you wanted to know about NET/ROM:

NET/ROM is a proprietary bit of firmware (from Software 2000) that plugs into the TNC-2 or clones thereof (replacing the standard firmware) and implements a datagram-based networking protocol that utilizes AX.25 as its point-to-point "link" level. It doesn't fit well into the OSI 7-level scheme for describing networks, but you can think of NET/ROM as being at level 3 and level 4 of that model without being too far wrong - which would put AX.25 at level 2.

NET/ROM incorporates a routing scheme that works by broadcasting a list consisting of triples of (dest,nexthop,quality) that are received by other NET/ROM nodes and used to build routing and destination tables. By the use of port quality factors, received route quality ratings are degraded as the destination gets farther away, leading to the ability to pick a "best path" among the known routes, and the eventual dying out of useless or cyclic paths.

Routing tables hold, for each known destination, at most three "next hop" listings. These are aged and recalculated when route broadcasts are sent and received, typically once an hour. In such a scheme, new routing information ("good news") travels relatively quickly, but loss of connectivity ("bad news") travels much more slowly, as obsolete routes need to age away.

When you connect to a NET/ROM node, there is a simple command interpreter that looks up your connection request to see if the callsign or node nickname is known. If not, a normal AX.25 connection is attempted. If known, an AX.25 connection is opened to the node listed as being the 'next hop' towards that destination, and a NET/ROM 'connection request' frame is sent over that AX.25 connection. When that 'CR' frame reaches the 'next hop' node, the process is repeated, until a series of AX.25 connections spanning the necessary nodes are open, and the original CR frame has been sent to the destination. The NET/ROM connection ("circuit") is independent of the AX.25 links it travels over; it is defined by the endpoints of the circuit.

(Of course, it is possible that the AX.25 connections between nodes may already be established, if other netrom traffic has been going that way, even if for a different final destination. If so, that connection will be used for multiple NET/ROM circuits.)

The destination returns a Connection Acknowledge frame, and henceforth data and responses are encapsulated within NET/ROM Information Frames, which are in turn acknowledged by Info Ack frames. There are Disconnect Requests and other such as well. Because of the required

NET/ROM header information, the data part of a NET/ROM InfoFrame is 230 bytes max.

A key point to remember is that the NET/ROM connections are END-TO-END. That is, the InfoAck frame comes from the destination of the connection, not from any intermediate hop. The AX.25 links between nodes do acks between nodes at level 2, but not of the complete span of the data link. It is possible for a NET/ROM circuit to survive the failure of an AX.25 node or link if an alternate path is known to the routing tables of the surviving nodes.

The NET/ROM protocol allows not only windowing (i.e., you can send more than one [usually 4] Info Frames without waiting for an acknowledgement) as does AX.25, but it allows fills - a missed frame in a window can be resent without having to resend all the frames following the missed one, which is a great advantage if your links or nodes drop frames. AX.25 is a "go-back-N" fill, so if a frame is missed, it and all subsequent frames have to be resent, so that a dropped frame produces a much greater impact on channel bandwidth than a dropped NET/ROM frame would.

In theory, however, the only reason a NET/ROM frame would be dropped is node congestion or failure, since the AX.25 links take care of getting the frames between nodes reliably. Still, it does happen.

Net/rom has some shortcomings: its routing is primitive, and tends to get confused if networks have lots of nodes and/or multiple routes between destinations. It is starved for memory in the TNC-2 implementation: you have to keep the number of known destinations and the windowsize down or you risk having node failures from memory exhaustion. (This last is a pity; if the window could be made much bigger, NET/ROM's efficiency could go way up, since you could ack dozens of frames with one ack.)

Because of the unreliability of its routing in a large complex network, a lot of people use NET/ROM by 'chaining' connects: they connect to a node, then connect to the next node, then to the next, etc., until they reach the destination. This makes separate connections between the nodes and actually make the channels MORE congested than if the chained connections were just AX.25 level 2 - since those links now have to carry the NET/ROM IF and IA frames in addition to the data. If the routing tables were correct when a connection were to be made, a connect to the destination without any intermediate hops will work better. (A side note on this: it takes careful tuning of the NET/ROM operating parameters to get the most out of a network; the defaults operate ok, but not at peak efficiency. Sometimes it's best to turn off a node's automatic route learning and just update it by hand.)

A couple of other notes: The protocol is documented in the NET/ROM manual, which you get when you buy your rom from Software 2000. It's about $60 or so for one rom, if I remember right. Your callsign is encrypted into the rom, and although it can be changed (I've been told how, but didn't write it down), it's a pain to do so.

Real NET/ROM in firmware in a TNC-2 won't keep up with 9600 bps - the packets get delayed. The processor in the TNC just isn't fast enough.

There is "TheNet" from Germany, that depending on which story you believe, is either a pirate copy of Net/Rom, an independent parallel development, a product of reverse-engineering, or the result of a falling out among the developers. The people who really know aren't saying, so the origin is the subject of much speculation and rancour. It works similarly to NET/ROM, but is free. Copies are found here and there.

G8BPQ has written his PCNODE software for the IBM PClone world that lets your PC act just like a NET/ROM node, only better. I think 4.04 is the current version. It's free and on BBSs everywhere. It comes with the DRSI PCPA card for the PC.

There is G8BPQ for the Kantronics Data Engine, which does 19.2kb on two ports quite nicely. Comes with the product, as I recall. They claim that it will do 56kb.

KA9Q NOS includes a partial implementation of NET/ROM, enough to allow a NOS station to participate in a NET/ROM network enough to route TCP/IP over existing NET/ROM routes. It's a hack way to route IP, but it works.

The Gracilis PackeTen switch uses NOS, but with the NET/ROM greatly enhanced. It will do 56kb on 3 of its 5 ports simultaneously.

The MSYS BBS has a partial NET/ROM implementation. It has bugs.

     - Brian

Hi there netters.

I have a small problem with the "host mode" on a PK88. At the moment
I have written a serial program that "talks" to the TNC, using the
frame format specified in the PK232 reference manual. That is:

<SOH> <CHANNEL #> < data here > <ETB>

Where the characters are the standard ASCII values for SOH and ETB.

The PK88 (which I'm using) accepts the frame happily, but then returns
the frame back to my serial prgram in an unmodified form, i.e. it
mirrors the data back. The PK88 is set up per the 232 ref man. but the
same thing continues to happen. I am using the 232 data because I've
been informed that the PK 88 is a cut down PK232.

So, what it boils down to is:

(A) Have I missed something in the 232 and 88 manuals ?
(B) Has anyone else had similar problems ?
(C) Has anyone used Host Mode on the above TNC's successfully ??

(D) Any other constructive comments ???

Any data or responses would be helpful (actually __VERY__ helpful)

I leave to you out there, with thanks in advance for any responses.

73's de Darren

I also found another little hint for using Baycom on a bullitin
on packet which allows you to somewhat mimic an alias (quick
way to address a mail message:

make up a file (use Baycom "edit" if you like) such as

Filename "vnh":
sp wa0vnh @ n0ihy.mn.usa.na
(Add the address if you like also here)

The "sp" is SEND PRIVATE and followed by the address of the
recipient. If the board requires the address, that can be
entered also in the file.

Now, when you want to send mail to "vnh", in the sent window
enter the command:
:v vnh

The file will appear in the RECEIVE window. Press the F9 key
(to get the cursor in the RECEIVE window) and cursor to the first
line of the file and press ENTER, wait
for the next line from the BBS that you are logged into to
appear in the bottom window (you won't see it with the cursor
in the RECEIVE window) and then press ENTER over the address.
This will transmit those commands.

Now press F1 to get the cursor back up to the TRANSMIT window
and you're ready to enter the message.

This can also be used to send other messages or pre-recorded
files.

Try it, send me some packet mail.

Mikef WA0VNH

>De Roland 7J1AKI/WF4P

The D4-10 is a 10W radio that's nominally tuned to 430 MHz. It looks like it could cover the whole band, though. It supports three modulations: 1) FSK of +/- 10KHz for 19.2KB packet; the FSK and receiver data slicer are in the radio, and there's a TTL level port on the back panel with RXD, TXD, PTT, DCD (from squelch); 2) 9600 aaud packet using normal K9NG/G3RUH modems; and 3) Voice. In reality, though, the voice mode is intended purely as a convenience; it's not really designed for everyday use as a voice radio.

It has two crystal-controlled freqs. The transmit turnaround is <very> fast, as is the squelch. Using squelch to derive DCD, we've run with a TXD of 6-7ms between a pair of them.

The receiver has two bandwidths; the narrow mode is standard 15KHz FM bandwidth, while the wide mode is 60KHz for 19.2KB.

We have a total of 10 of them going into a local high-speed network and a backbone, and so far have no complaints about the hardware (though it would have been nice if the power level had been 25W rather than 10, but that's a local terrain problem).

You should also note that in many areas ATV makes finding a home for wide-band packet quite difficult; even though ARRL says 430-431 should be available for packet, ATV on 426.25 can cause problems up there. I'm speaking from experience...

People, and I use the term advisably in some cases, you have
caused me to to break a hard and fast rule.

I have, for some 4 or more years now, been reading with interest
the various amateur radio news groups on this net. I have a self
imposed rule - "If you do not have something to say - do not
prove it by saying it". I am now, and probably to my regret, going
to make my thoughts, I do have some once in a while, known.

rex@lgp.b23b.ingr.com (Rex A. Simmons) wrote what I thought was
and inciteful message to the ham community. To Rex I say attaboy.
I am not sure what makes some Hams think, because they have
a license, they are the holiest of holies. They seem to feel that
since they had to "study" hard to get their license back in
the "good old days" that everybody should have to go through
the same "strain and pain". To those people I say "Get Real".
How many of you have had to roll over "CDs" at 3 to 5 percent
less than you were making on them a year ago. That is the way of
life, things change to accommodate the needs of the present time.

To the "bashers" of Radio Shack, "knockers" of certain
manufacturers, I say if you have a problem with RS or somebody
else, make it known to them - NOT *CONSTANTLY* TO THE NET. If
someone has voiced your thoughts on something, how aout a simple
"I'll second that" rather than a 200 line disertation that says
the same thing. I wonder how long soem business establishements
are going to put up with the cost of this bandwidth.

To those of the "Repeater Gods" flames - Please take the wars
to, is it "alt.flames", and lets get on to things like what is
currently happening at WARC. "What is the ruling on low orbit
satellite allocations going to do to the spectrum?"

I know I have rambled on, :-), but I am torn between a capital
'k' for most subjects in the ham news and a 'u' for the whole set
of ham categories.

CAN'T WE ALL GROW UP??????????????????????????????

Before you all kill yourselves trying to figure who/what I am to
answer this way, I am an Advanced Class Ham, send and receive
CW somewhere in the high 20s to low 30s but will drop down to 7 or
8 to help someone make a contact. I like to work 10 meters
pretty exclusively. I was first licensed in 1962. I play
around with RTTY and SSTV and will get in a contest on occasion.
I carry 2-meters in my car for company during a long commute.
I still enjoy the swim suit edition of Sports Illustrated. :-)))
Except for my age, over 60, I *HOPE* I am what could be called
"your average ham".

I will be happy to continue this thread "OFF LINE", via e-mail,
but reserve the right to ignore flames for the sake of flames.

All standard disclaimers should be applied at this point.

Hello,

At the Dayton hamfest last year, a local ham (also on the net) bought
the Gracilis PacketTen 5-Port packet switch. He also got a PacketTwin
and 2 G3RUH (right call?) 9600 modems, plus one Kantronics 1200 baud

modem card. We have just finally gotten everything together along with the needed time to get the whole system installed and running. There were a few hurdles, but hats off to Don Lemley (N4PCR), of Gracilis, for his abundant time and invaluable assistance! Thanks ever so much Don!

At any length, the PacketTen is a wonderfully elaborate system and for that reason, I have opted to setup an Internet mailing list for those using (and/or interested in) Gracilis packet equipment. It will be the weekend before I will have time to configure everything, but for starters, the listserver is:

    listserv@mtsu.edu

and you can send 'help' or 'index' to monitor my progress. If no one else signs up, I won't be offended! :-) I will make another announcement with more details when things are ready-set-go.

I would still like to hear from you if you think you would be interested (just in case something happens and I don't get the list setup as soon as I would like).

**Note: I have *NO* connection (whatsoever) with Gracilis except for the fact that it is a neat new toy that we are very excited about and may actually assist in the education of the "AX25 Dumbells" that our area is so inundated with. Since we own the switch, the radios, and basically control the 2200 foot tower site, they can eat mud if they don't like it! Anyway, that issue is a bit of a soapbox and I won't go further into it.

I hope that the list will serve as a round table for setup/debugging/etc that includes the Gracilis crowd. We shall see.

73's,

Mark.

Dear technofiends:

I am a science fiction writer and new to the net. I'm writing a feminist cyberpunk novel, that deals a lot with radio broadcasting. Specifically, the book takes place in 2076. An international pirate radio network, calling itself World Radio, undertakes to connect, organize, and retell the stories of poor people worldwide.

Here are the broad strokes of the technical side of World Radio that I've come up with so far.

There is an integrated communications network comprising all ground and satellite communications. It's a kind of public utility. (See Ithiel Pool, Technology without Boundaries.) Corporations pay for time used. It is optical, packet communication and wireless satellite transmission combined. Voice, Video, Data. Mobile individuals can access it via satsets, hand held voice, video, data receivers. Each person has a HANDLE that identifies packets for point to point communications. Broadcasters have HANDLES. If you want to receive a certain broadcast, you program your satset to receive transmissions from that handle. For broadcasting purposes, packets are able to multiply in the stream.

WORLD RADIO has no registered handle of its own. It steals time from corporations. Packet riders. It is mobile, multiple-origin transmission. Pirate handles change daily, like the names of heroin packets. Chips translate from one language to another.

My questions, for anyone who'd like to take a shot at answering, are: what do you think, in general? Is this even anywhere near what you could imagine being plausible?

What kind of security would corporations have to protect both optical and satellite transmissions sent over a 'public' network?

How could World Radio 'piggyback' onto other transmissions for a free ride?

How vulnerable would WR broadcasters be to retaliation?

What is spread spectrum radio and does it have any relevance here?

If you are at all interested in assisting me to come up with a more detailed, plausible scenario, I would be thrilled to give you full credit in the book, if it gets published, of course!

Just so you don't think I'm a nut, I've had a few plays produced in New York and am in the graduate writing program at Mills College in Oakland, CA. My first novel, about nuclear anxiety,

was completed in 1991 and is being considered by an agent.

You can contact me at SYD@IGC.ORG

Distribution: world
Message-ID: <clemon.07b4@lemsys.UUCP>
Date: 7 Mar 92 18:59:51 EST
Organization: Private UUCP "Twig" Node

What commands can you issue to the MS-DOS version of NOS to allow it to repeat all transmission received on an AX.25 port to the SLIP port even if they have no relevence to the node connected on the SLIP port? I connect to a friend of mine via SLIP and he has a TNC on his AX.25 port and I would like to be able to use 'trace' here (amigaNOS v2.8s) to view _ALL_ transmissions occurring "on the air". This gatewaying should preferable be one way so that all of my telnet sessions and ftp's to HIM are not broadcast. Is this possible?

I'd like to expand the forum to include the MFJ 1278, for reasons that
will become quite clear below.

All 3 TNC's, being TERMINAL node controllers, obviously work with
pretty much any terminal emulation program.

They each have their specific weaknesses and strengths:

	KAM	PK232	1278
True dual-port (simultaneously)	yes	no	no
Max Radio Speed w/new modem	2k4	19k2	19k2
Standard TNC2 commands	no	no	yes
Mailbox	yes	yes	yes
PktGold compat "host" mode	not yet	yes	no
Modem quality	fair	fair	excellent
True DCD	no	no	yes
Flexible radio ports	no	yes	yes

The KAM requires manual switching of cables for some modes; the PK-232
and MFJ 1278 do not.

If you want to use both HF and VHF ports at the same time, the KAM is
the way to go. Otherwise, for general multimode use, I personally
prefer the MFJ 1278, which has a true DCD state machine. The KAM's

"software Carrier Detect" (at least on version 3.00 ROMs) doesn't
work very well, and will exclude some stations :-(I've reinstalled
my good old TAPR DCD state machine in my KAM.

Mike

Hello all packeteers,

I'm using baycom 1.4 right now for my packet ops., and
want to run it under windows 3.0.
How to do that ?

Specific questions :
1. Where should I run the L2.EXE, outside or inside Windows,
2. How to setup the PIF for SCC.EXE

I've tried the generic PIF that Windows made for every DOS apps,
Baycom can be launched but I cant send or receive anything.

Hello Packet Netters,
I know this not a packet thing but mabye somone could help.
I just got into rtty and I had to writr my own termenal program,
but it is real basic. It has no printer option (i can write that in)
but I can not send files (send messages) from my drive.
My RTTY unit is an old Kamtronics "UTU" and the software I got with it
dose not work, and I can not read it. Can somone tell me were to get
a term program that I can use with this TNC. some body told me to
get an IBM system disk and get the "COMM" file from it, but as yet.
thanks for the band space.. "73" de N1IQQ

I understand that the ARRL, etc encourage the usage of compression,
and that it is not considered encryption. Perhaps this should go
on the FAQ if it is an FAQ? Or is it already (and did I miss it?)

Here are some responses:

 1. ucsd.edu   under hamradio/packet
 2. wuarchive.wustl.edu   under /mirrors2/misc/hamradio
 3. funic.funet.fi   under /pub/hamradio
 4. tomcat.gsfc.nasa.gov   under ham

I had problems with (3) and (4) may be traffic congestion.
(1) and (2) seems ok. I could not find the FAQ for this group.
I wish they archive it (if it exists).

Thanks to the following responses:

Packet Radio folks,

I've gotten some response to my wild idea. Most respondents hate
CB as I do. My suspicion that there were regulations concerning
radio REMOTE control that allowed these operations on the same
frequency as CB ch. 23 was neither confirmed or denied. The
regulation as I remember had no restriction on the type of
encoding.

I know that there is a network remote control group listed and I
tried to contact them but didn't have any success. The people that
answered from a CB reg point of view, "NO WAY" are, of course, very
right. Most also said that CB is so poorly enforced that you could
get away with it for a long time, but eventually the feds would get
around to providing a room and board program as some kind of reward
for technical innovation. The program did not provide for fresh
flowers, but the room service was said to be comprehensive.

The remote control radio service is strange. The reg. said that
identifying the station wasn't necessary, over the air at least.
The regs for this seemed to be more pointed at having the frequency
on the controller. I think so that battles with model war
equipment could be "fair?"

The best question was, does the reg mention that you had to be
controlling a VEHICLE? My question is then are some of the video
games that I see all around models of vehicles? I think that the
frequency could be used to control decontamination equipment that
was full sized.

One of the better answerers said that, if idea was workable, I
wouldn't hear much about it. I haven't heard much for a while now?

Mitch

Packet BBS software can be FTP'd from 'tomcat.gsfc.nasa.gov'.
It's in the directory bbs/* (w0rli, wa7mbl, etc.)

Tomcat is run by Dr. Tom Clark, W3IWI.

I am sure I am not the first to think of using some sort of terminal
software with built-in compression with 1200 baud packet. Does anyone
know of such a program via FTP. What are the legalities of use on
the ham bands? Compression is not encription for the purpose of
conceiling the contents of the message.

Greetings,
     I am looking for more info on the uses of Packet Radio.
I would like to know if one can use it to get to the Internet,
for example. I would also like to know what regulations there
are as to the content of data sent via Packet Radio.

                  Thank you for any help,
                       Andre

>The standard fields (Sender:, From:, etc) all require RFC-822 addresses.
>If you must do it this way, I would use the user defined X headers, ie:
>"X-Callsign:".

Another way, and relatively simple to implement, is to look at
the standard From: line. After the <userid>@<somehost>.<somenet> there is
a field inside of () -- normally the user's real name. Why not use (or add)
the callsign there? Most mailers have a way for individuals to specify
what goes in that field.

Cheers,

I am still looking for a Sat Program for the Amiga Computer. If anyone has
someone or knows of a place to FTP it, please leave me a note.. I also need
docs.. Seems there are several versions out there,but few of them have any
docs..

I would like to say can all of the Authors get together and have one common
compression NET/NOS WNOS GNOS GRINOS are all now with LZW compression
in the near future there will be added the S.F compression added to WNOS
this will use the [WNOS-XH$] where the X is pressent if the compression is
enabled.. It would be nice to have a World wide compatiblity between Us all
I have used the WNOS compression on SMTP not for some months and the saveing
on the sent mail is well worth the use... I have tested FBB NNA codes and find
that the compression does not work as Efficently as LZW.. I have had a Comment
from a UK BBS author that there is a copy wright on LZW If you care to read
the Comments from Anders Clemmetts about the use of this LZW in BBS and NOS
you will see that there is free use for experimental BBS and NOS use...
It is a very compact compression its fast and easy to implement to a BBS/NOS
without reinventing the Wheel.

That's a comment field, and the mailer is under no real obligation to
preserve its contents. Nor, indeed, to retain it. Most do, but some
don't.

The X- prefix for header lines is documented and should work.

Actually, as we've discussed here before (see the archives), the best
way to do forwarding between the internet and the hambbs network would
be to conjure up a transformation between addresses in the two
namespaces.

I see no reason why WB6XYZ@WB6AAA.#SOCA.CA.USA can't be transformed at the
gateway into the internet into something like WB6XYZ@WB6AAA.BBGW.GWSITE.EDU.
Presumably the BBGW mail system at GWSITE will have made a note of routing
hints (those things after the simple hostname that look like domain
hierarchies but aren't) and will be able to do the reverse
transformation on the reply mail. The only trick is to make sure that
*.BBGW.GWSITE.EDU has an MX record pointing to the BBGW gateway system that
knows what to do with addresses of that sort.

Loading a bunch of known route hints into the BBGW gateway would solve a
lot of the startup problems. The gateway could even cope with such
excrement as "WB6XYZ@WB6AAA.#SOCA.CA.USA.BBGW.GWSITE.EDU" if it had to.

Has anybody used CBBS? I think it's the only packet bbs
written in C code. Possibly the only one you can customize?

You are correct in your assumptions. You can either reprogram the
clock source between transmit and recieve or you can add an external
clock source. I chose to use a 74193(?) counter/divider for external
/32. For me, this also provides a tap for the 16X clock the G3RUH
modem needs.

Fellow Hams,

Here is a question that has been on my mind recently:

What is the average bit rate of a message that is originated on packet radio from your station?

By average bit rate, I mean take the number of bits of the message (the number of bytes times 8 bits per byte) and divide that by the time in seconds it takes to send the message. The result is a rate in bits per second. I wonder what you come up with for HF and VHF packet.

Here are some other questions:

a. How does your average bit rate compare with the instantaneous bit rate out of your transmitter? For HF the instantaneous bit rate is 300 bits per second. For VHF the instantaneous bit rate can be higher, 1200 bits per second, for example.

b. Are you satisfied with the average bit rate at which a messages is being transmitted?

c. If you are not satisfied, do you have any suggestions for improvement of the average bit rate?

Thanks in advance for your interest.

73,

Rick Gaus

After our very productive Midwest Packet Seminar held on February 8th we heard
of some alternatives to purchasing Kantronics Data Radios.  The alternative
is to convert surplus commercial 2-way radios to the 430.xxx MHz range and
make the necessary discriminator/varactor diode connections.  From what I hear
certain manufactuers and specific models are sutiable targets - others are not.

If you have had experience making these frequency conversions and High-Speed
(9600 baud) modem interface to any brands of commercial surplus equipment
please let me know.  (I have all back issues of TAPRs PSR so please do not
include radio conversion/interface described there.)  I am particularly
interested in 406 - 420 MHz MiTrek from Motorla as I have located a source
of them.
```

I thank you in advance, for any input you can provide.

For better than two weeks, I have been trying to interface a new Kenwood TS-450S/AT to a AEA PK-232MBX using the 13-Pin DIN plug on the rear of the TS-450S. The problem was a feedback loop that really screwed-up the transmit SSB audio when the 13-Pin connector was attached. Finally found the FIX!

Followed the old ham rule. If all else fails, GROUND IT! I ran a REAL ground wire from the PK-232 to the ground lug on the rear of the TS-450 and the SSB transmit audio problem is history! I attached the new ground wire to the PK-232 circuit board using the top-side screw for the right rear mounting foot (near the 12 volt input connector).

Yes! the PK-232 was already grounded using the ground wire in the AEA supplied cable. I suspect something weird with the grounds in the Kenwood ACCY2 port. Not sure why the new ground wire works, but the price was right and the PK-232 and TS-450S are now working FB.

I have talked to many Kenwood (and Icom) owners on the air saying they had the same problem and either have to unplug the 13-Pin plug to work SSB or do the interface via the MIC connector.

Hope this easy fix helps someone.

I have a US Robotics Dual Standard modem I would like to swap for, or sell for
enough to buy, a AEA PK-232MBX.

I can get the 232 for $340 here, so either $340 and you pay shipping, or
a functional 232.

For those who are unfamilar, the modem will do all of the low speed modes <2400
as well as V.32 V.42 and the USR 14,400 HST mode. The modem is in great
condition, in box with manual. I just never use it.

I have been thinking of putting up a packet bbs on my xenix/386 machine. So,
I downloaded all the stuff on ucsd.edu to see what is available as far as
software. After looking through these files, I am very confused as to what
files belong with what package and exactly what packages I need to get going.
I understand internet, ftp, telnet, ip, slip and all those kinds of things;
but, how does all this stuff fit together? Any help is welcome. I have ftped
all thefiles from the hamradio/packet/ka9q/sys5 directory on ucsd.edu.

Terry

Its amazing...after you ask a question of someone, the answer sometimes pops into your head. I reached the same conclusion after filing the first posting! (Great minds run in the same ...). It solves a lot of problems to use the translation tables in both directions.

1. It precludes use of the system by non-hams, which is probably illegal.
2. It provides the "sender" call, resolving problem #1.

I plan to do this, but thanks for thinking about it!

>>2. How do you specify that the message is type "T" or "P" or "B" ?
>How about "X-Type: B"? (and use to P if there is no X-Type:)
>(What's type "T" used for?)

"T" is "Traffic" for the National Traffic System boys.

>
>>3. How do you send a BID?
>Another X (user defined) header: "X-BID: ..."

The thing that bothers me about X headers is that everyone who wants to use the gateway for bulletins would have to actually modify their sendmail or whatever does their header generation to generate X headers. Maybe making the first line of the text "BID:" would be better?

I am useing the built in SCC chip. Currently I am useing the A&A baycom kit for a modem. After this is compleated I was thinking of makeing a skeleton TNC board with power and a standard modem disconnect header but no cpu or scc, it would hook to the mac serial port. I have a couple TAPR KN9G 9600 baud modems but haven't put them together or studied the schematics yet. TAPR is comming out with a new 9600 baud modem soon also.

You might want to check out the book 'Z85C30 Serial Communications Controller Technical Manual'. They say on page 5-4 that there is a hardware bug in the NMOS Z8530 such that if the BRG is disabled and reenabled it can underflow to 0xFFFF causing a one time very long count. They suggest loading the BRG while it is running LSB first. I think you might want to check the values of the old and new constants, for example if the old value was HIGH=0 LOW=4 and the new value was HIGH=7 LOW=0 then you could still get into trouble. I would think you would look at the new low and high values and if the low is zero load the high first.

Does anyone know if any versions of the macintosh are affected by this problem, or have a list of which versions of the mac use which SCC chips?
Aaron

Greetings. I've been having trouble with MBBIOS v3.4 (and v3.5, but I only have the source for v3.4). I'm using just 8250 UARTs. The WRITE BLOCK function can't cope with a block length greater than the buffer size.. reported back all sent, but only sent (block length MODULO buffer size).
I've fixed that problem. Now I've found another one....
The READ BLOCK function doesn't check whether to reenable transmissions if hardware handshaking has been selected. (To be fair, I haven't tried this on v3.5).
So I have two questions:
a). Is there a more up-to-date version of MBBIOS that I should be using

    (and is the source code available)?
b). Is the author of MBBIOS contactable by packet or e-mail, so I can
    make known the problems?

73, Andrew   adsb@bnr.co.uk
                  g8fsl @ gb7hsn.gbr.eu
                  g8fsl @ g8fsl.ampr.org [44.131.19.45]

(Oh, and another thing.... if one unloads MBBIOS with a '/U' switch,
 the UARTs still cause interrupts, the 8259 still passes them on, but
 the IRQs have been restored to the previous owner.. which on my system
 were 0000:0000. Guess what happens!)

I'm running an old(er) PK232, which was upgraded with 1987 ROMS
a few years back.

AX.25 works swell.

But after installing a new version of GRINOS, I find that, while
I can transmit packets successfully, the TNC holds on for dear
life and won't burp out so much as a character of data to the
computer.

KE3Z and I agree that there's likely an easy cure, perhaps in the
form of a simple command to the TNC.

Any of you know how I might make it happen?

Again, TRANSMIT works great. I can ping the locals, but without
data from the TNC being sent to the computer, I'm S.O.L.

Thanks, folks, de KY1T

Hello world!! I called Kantronics this morning trying to order
HostMasterII plus and the v5.0 EEPROM. I was told that QST
jumped the gun by one month. Both the items are to be ready
in March. She did however take my name number and card number
and will ship them in about three weeks. Far be it from me to
bash QST but it looks like they made a slight booboo, this
time.By the add it looks like the Kam will have mailbox capability
for both Packet and AMTOR and still operate VHF/UHF packet.
I like my KAM!!!!!!!

  But then you need to register *EACH* gateway user w/ a callsign. I think
I like X-Callsign: better. That way you could automatically forward stuff
that has X-Callsign, otherwise check your table.

[type header deleted]
>>>3. How do you send a BID?
>>Another X (user defined) header: "X-BID: ..."

>The thing that bothers me about X headers is that everyone who wants to

>Maybe making the first line of the text "BID:" would be better?

It turns out that several mail user agents allow the user to specify additional
headers (mush, at least, and also Rmail in Gnu emacs, I think -- I only use
mush). For example (from my ~/.mailrc):

my_hdr Reply-To: steve@Wattres.San-Jose.CA.US (Steve Watt -- KD6GGD)
my_hdr X-Favorite-Animal-Sound: Squirp!
my_hdr X-Least-Favorite-Sound-On-2m: SKREEEEEEEEEK! (Lifted from KC6WCH)
my_hdr X-Callsign: KD6GGD

Obviously, this can be used to pollute the headers (who, me? ;), but it can
also be used to do useful things, like Reply-To: and X-Callsign:, and
X-Whatever-Other-Header-Stuff-You-Might-Want:.

I have seen several people in the area running pre-release 5.0
firmware (KANtronics = KANsas. See why I see pre-release firmware? :))
From what I can see, the mailbox improved the most. The
PBBS help command now looks like a RLI command list. You can specify
the type of message (B,P, and T) for reading, sending, or killing.
Also, I think the PBBS will also accept AX.PBBS mail messages from the
radio port and then, after sysop approval, reverse-forward them to a full
service BBS. (Useful for communities that do not want to support a
full service BBS, but want a local community mailbox.)

The KAM is the most over-programmed box I have seen. I was told by
reliable sources that the KAM eeprom was filled up 2 revisions ago,
yet they keep coming out with new features. Kantronic's
programmer must be a bit crammed!

Yes, CBBS is written is C but it is not the only one written in C. Both the
W0RLI code (CBBS is the forerunner of the present W0RLI code put into the
public domain) and MSYS are written in C. There is another, TNBBS, also
written in C. CBBS has been modified greatly since Hank, W0RLI, placed it in
the public domain and it is still supplied with the source code so hackers
(or would be ones :-)) can have fun and add their own routines. However, care
must be taken to keep it downwardly compatible with the other systems, pro-
vided one wishes to communicate with others than him/herself. An interesting
addition was made to the CBBS code a few years ago by some programmers in

Colorado which were very helpful in poting and handling NTS traffic in proper formats, etc.

CBBS doesn't do many of the fancy things MSYS does through using KISS mode in a TNC but, over all, it is a well tested, stable program. And, with the source code included, it is a great way to learn C progrmming!

I am looking for the best place to get a current callsign database. Has anyone dealt with NTIS? Any comments. Also I saw an ad in a magazine just before the new year that had a database on floppy for about $75. I can't find it and I wonder if anyone else knows of this company or has dealt with them. Please respond via email and I will summarize.

Hooray! Someone's said it at last.

G1NNA and G4YFB mailboxes will be compatible.
F6FBB will not be compatible with NNA/YFB.
AA4RE ? (are you there Roy ?)

As far as I can tell, none of the mailboxes are WNOS/LZW compatible.

B> NET/NOS WNOS GNOS GRINOS are all now with LZW compression
B> in the near future there will be added the S.F compression added to WNOS
B> this will use the [WNOS-XH$] where the X is pressent if the compression is
B> enabled..

WNOS mail compression does indeed work well. The 'tightness' of compression can also be varied across machines since the compression characteristics are communicated in the initial handshaking between server and client.

In my experience, adding compression has a disadvantage in that it requires a considerable amount of CPU guts. The LZW implementation removes the drawback to some extent through the handshaking at startup. Users on a slow XT can set their compression looser (less CPU work) and still gain a benefit through the compression.

Cheers, Mike (G6DHU)

I have looked at LZH but its very memory hungry. Those of you who run
my BBS know that every byte is precious so I have been looking at LZW.

I have made a proposal which was for a compressed data stream on top
of AX.25. This data stream could then be used for BBS, users, etc.
It was LZW based. The proposal died for lack of interest.

I am kind of waiting for the compression wars to end but demand
for that feature is heating up. My next project will be either
compression or KAM support (including AMTOR!).

I've used a PK232, and have a PK88. I'm also very familiar with the MFJ1278.

I've NEVER used a KAM. I'm thinking of trying one.

1) Does the KAM work well in the absence of dedicated software? (For packet and applicable modes, since I assume it's needed for FAX, etc.)

2) Does the KAM have a feature similar to the PK232 SIAM command?

3) If I use a KAM with a portable dumb-terminal, what issues should I be aware of that differ from the PK232?

4) I use Macintoshes. Is there anything about the KAM that will make me wish I had a different controller for use with a mac?

5) What can the KAM do that a PK232 can't?

6) What can a PK232 do that a KAM can't?

7) What subjective reasons are there for buying a KAM?

8) How popular (ie, common) are KAMs compared with other controllers?

Any responses to this are appreciated. I'm trying to get a feeling for the digital controller market, and hope to learn if the KAM is for me.

Your best bet is to leave the BSD system as-is and gateway it to the
AX.25 channel through a small dedicated stripped PC running NOS. Use
Ethernet to connect the two. Then you can provide true IP access to
your system over the air.

The most you might have to do is to update the TCP in the BSD kernel
to a version no more than a few years old in order to make sure it
behaves reasonably well over a slow and lossy path.

Version 1b update
Version 1b adds commands to test sending packets. I had a couple of
requests from hams building modems to be able to test transmit.
DTR is raised to high to key the transmiter. Two new commands in
the test program f - set from field of sent packets and s to send data.
Sample usage: fn3liw<return> send packets from n3liw. shello, test

packet from the mac. This will loop sending a packet from id sent
with f to CQ. The packet is an unnumbered information packet with
the R bit set (I copied what my paccom tnc was sending for the ID
command). Type any key to exit send mode. The rest of this
document is the same as version 1.   The next update is targeted for
march 9 to contain the specification for interfacing to the device
driver. The softare is available from host akutaktak.andrew.cmu.edu
[128.2.35.1] directory /aw0g/soft_kiss1b.sit.hqx.
Overview SoftKiss Alpha 1 Feb 23/92
Softkiss connects a modem directly to a macintosh. This saves
having a TNC. Softkiss will work with 300 baud HF, 1200 baud VHF
and higher baudrates. The software is in the early stages of
development and is not useful in everyday work at this time.
Softkiss is public domain and may be used by anyone for any
purpose. However, please credit the author.

No, my best bet is to use what I have sitting here right now rather than
spending money to install a piece of redundent hardware.

> The most you might have to do is to update the TCP in the BSD kernel
> to a version no more than a few years old in order to make sure it

Getting NOS running on this machine is an interim fix that will allow
me to get an IP server system on the air now. My final goal is to build
AX.25 and KISS support directly into the kernel (ala SLIP) at which
time I can punt NOS and just run it all native. Since the manufacturer
of this system (NBI) does not ship any kernel reconfiguration tools
(can you believe it? no config(8) or /sys/foo/OBJ directory!) it's

going to take me a bit longer than it normally would to perform
this task.

So, I ask again: is anyone running a NOS port under *vanilla*
4.2BSD?

Does anyone have any information about something new (in the US anyway)
called PacTor? It is essentially AMTOR with an extended character set
and possibly more. I have heard that AEA is offering an upgrade to the
pk232 that will at least extend the current AMTOR standard so that the
character set is not limmited. I don't know if this upgrade and PacTor
are related. It is supposed to be part of one of the MailBox upgrades
for the 232? any info would be appreciated.

Thanks,
Chris

Not necessarily. I have been in touch with FBB and several other BBS
software authors, and everybody has expressed an interest in having a common
compression standard. I'll be circulating the first `draft' in a few weeks.

Subject: Combining TNC's on one rig - summary
Message-ID: <1992Mar2.112332.2381@ips.oz.au>
Organization: IPS Radio and Space Services. Sydney, Australia.
Date: Mon, 2 Mar 1992 11:23:32 GMT

As promised, here is a summary of the replies I got, asking about how
to combine several TNC's on the one rig:

From: mark@ve6mgs.ampr.org (Mark G. Salyzyn, VE6MGS)

Well, Dave, there is an interlock system already in place. A Squelch
busy signal can be `ored' together from the Rigs Squelch (recommended)
and the PTT line. As soon as one of the TNCs keys the rig, the others are
held back by the busy signal (DCD).

On some TNCs, this input to the TNC is called SQ, or RF DCD. I remember
that it is just another DCD input to the TNC.

Good Luck, 73 de VE6MGS/Mark -sk-

From: Bill Healy <healy@moriah.ee.unr.edu>

PacComm sells what they call an NX2P Radio Multiplier-II. As I recall it lets
you connect 4 or 5 tncs to the same radio and do what you want to do and it
also lets you connect from one tnc to another. I saw it at Dayton and got some
liturature on it, but I can't find it now, only thing I could find is their
catalog and it lists it at $89.95US. It shouldn't be to hard to design, feed
the audio from one tnc to all the other tncs audio ins and also to the radio.

Have each tncs ptt connected to the other tncs DCD so that when one is keyed the others don't key over it. A few op amps here and there to get all the levels right and maybe a few analog switches (4066) here and there to control where the audio goes and you've got your combiner.

Bill N8KHN/7
   Healy@Moriah.ee.unr.edu

From: brian@UCSD.EDU (Brian Kantor)

A lot of TNCs have a 'hardware squelch' input, which simulates carrier detect internally. You could just diode-OR all the PTT lines together and use that sum to nail the carrier detect, which would hold off the other TNCs.

As a note, most TNCs will ignore a transition of the DCD line once they have keyed the PTT, so you don't even have to make provision to ignore your own PTT.

At 4 pennies a diode, it's a cheap solution.
     - Brian

From: Angelo_Glorioso_Iii@agwbbs.new-orleans.LA.US (Angelo Glorioso Iii)

 It is possible to do what you have mentioned. Matter of fact, there is a guy in Baton Rouge, La USA who has done it. He has ROSE and a TNC2 hocked up at the same time..

He does not have a UUCP address but can get reached at KD5SL @ KD5SL.#BTR.LA.USA. I am sure he will be glad to help out..

73 de Angelo

From: <Iztok.Saje@ijs.ac.mail.yu>

Several years ago I used such scheme for YT3A BBS. Both KPC-2 running normal code to MBL SW and TNC-2 running NET/ROM [yes, in 1987 we used original NET/ROMs] were connected to same radio. In fact, even modem was only one.

Signals are:

 MODEM: TXD,RXD,PTT input, CD output
 TNCs : TXD,RXD,PTT ,CD

I programmed one EPROM as logic [lazy for soldering].
When modem has something to send (cd) both TNCs listen.

When TNC has something to send another TNC + modem are listening and
it is transmitted. There is no DOCs or files - but I think with
this idea it is very easy to make it.

Thus, QSO between two TNCs is possible - bad side is that it is QRMmed
over the modem as well.

This trick was doing fine job here - until G8BPQ made it obsolete.

Of course, if you want multiple modems on same radio, story is different.

From: BOB SCHAFER <RLSNSDL@ducvax.auburn.edu>

dave...i do it w/diodes es 2k resistors...
no need to use active components...
u do need to cross connect the
ptt es dcd lines so one tnc knows
when the other is keying the radio...

what is interesting is that one tnc
will key immediately after the other...
thus, if u have modems at different
speeds u hear two tones without
the radio stopping transmitting...

cul/73/bob (ka4pkb)

From: tadd@cheetah.ece.clarkson.edu (Tadd Torborg)

NX2P created a PC board which does just this. It's called a
radio-multiplexer and PacComm sells it. If you sent NX2P a packet
or letter he might mail you the schematic or something. The board
doesn't look all that complicated. I think that it sells with cables
for between 100 and 200 US$. If you need more info on how to get
ahold of NX2P (Bill Slack) I can supply but don't have it on hand as
I type this.
   Tadd, KA2DEW

Following pressure from our users (choke, gag!), we reluctantly installed
a YAPP server on our BBS, which was dropped when we went from MBL to W0RLI.
The BBS runs the BPQ switch, and the lot runs under DesqView to provide
multiple sessions and the server. Sorry I can't be more specific than that,
but they are recent versions (I'm the weekly-basis Sysop, not the daily-basis
Sysop :-).

Anyway, when YAPP fires up (we permit only one YAPP process) you can kiss the
frequency goodbye - humungous packets, with little delay. It seems to assume
it has the frequency to itself, which of course is now true :-(

Is there any way to wind it back, to be a bit more polite to other users?
Some parameter to tweak? The documentation says little.

How about adding Jean-Paul F6FBB to the W2XOs internet gateway? I haven't seen
him on internet yet?

I understand LZW is owned by Unisys, perhaps the stalwarts in comp.compression would be best placed to answer this?

If you are going for a compression technique to be a standard in the packet world, why not go for one of the latest techniques? HPACK, LHARC, LHARC all have source code available, approach the authors and see if they'd mind an advance in the world of Packet Radio...

Dosen't compression count as encryption tho? What are the issues with encryption and packet radio?

NET/ROM is a copyrighted commercial product. There is a very
controversial (generally recognized as plagerized) source code
version from Germany called TheNet that you may see around. There
is also a non-infringing implementation of the protocol in the NOS
code.

Ah, that one again! I honestly can't see how compression could be taken to
be encryption, since anybody could monitor the transmission of a compressed
message and (as long as they new the compression method, which won't be a
secret) uncompress it. If the compression method was kept secret then there
would be a reasonable case for saying that encryption was taking place, but
as the idea is for as many people as possible to know about it and use it,
it is hardly going to be secret! If compression is encryption, then so are Q
codes, morse, RTTY, AMTOR, packet, ...

No. It's just binary data. As long as the data is decodeable by a
generally available program, I see no problem at all. Just to be safe
you should make sure you have the decompression program, too, just
in case some fed suits come by to visit. The basic idea is that you
are not trying to hide your communications on ham radio.

I added: Followups-to: rec.radio.amateur.policy
Legal issues of ham radio should go there.

Issues about choice for packet radio should be on r.r.a.packet and
technical discussions probably still belong in comp.compression and
sci.crypt (not applicable to ham radio).

Hi packet radio folks,

     I'm Mitch from Colorado and thought that I'd ask you all a

question:

Would it be legal, practical, and/or ethical to:

1. use the remote control frequency that is the same as citizen band channel 23,

2. at 25 watts of power,

3. to remotely control a model of a personal data communication system,

4. for hire,

5. with the same kind of computer, terminal node controller, and software developed for ham packet radio?

Please don't laugh! Sometimes I read old copies of regulations. Uasually, by the time I get done reading the regulations, I'm old, there old. I'm almost always older and broker by the time I get the regs way out here in Colorado.

Please respond to my personal address.

Remotely yours, Mitch in Durango, s02337@FLC.colorado.edu :)

My wife (N6WHJ) and I plan to retire next year and depart on our boat
(a Valiant 40) for a circumnavigation, taking 5-7 years (and who
knows? maybe longer).

Can members of the list suggest a method for having email communication
enroute? I have an AEA PCPAKRAT 232, an ICOM 735, and a Diconics 12v
printer that I used to get weatherfaxes on a voyage we took a year or
so ago from San Francisco to the South Pacific, Hawaii and back. Also
have a couply of ICOM 2GAT handhelds. Antenna on the boat is an
insulated backstay with a large amount of counterpoise glassed into
the hull, and an ICOM AH2A automatic antenna tuner, which works well
on the HF ham bands.

I use the PCPAKRAT almost exclusively for the Northern California DX
Club's Packet-Spotting Network, although I have made one or two RTTY
contacts, just playing.

Any suggestions?

NNTP-Posting-Host: ucsd.edu

Just thought that some people might want to hear about some of the problems that I have documented with the Kantronics DVR2-2 radio.

I have two of these radios used at 1200 and 9600 baud. The problem with their front end's being as wide as all outdoors is pretty well known. Since I feed each of mine through 6" bandpass cavities, this pretty much solves that difficulty. However, they also have another very insidious problem.

The first stage RF amp in the receiver is a MPS5179 transistor. This part seems VERY subject to damage from nearby RF fields, *AND* lightning strikes anywhere in the adjacent area. How close "adjacent" has to be I am not sure, but out of one lightning storm this year.... all three DVR2-2's had the exact same damage while all other radios at the same site were untouched. As a note, the antenna was at DC ground, the hardline was grounded to the tower at the top and the bottom, and a Polyphaser lightning protection system was also in place.

The damage these transistors show is often not obvious. They don't just fail leaving the receiver stone-cold-dead, instead they lose between 6-10 db of sensitivity. This loss of receiver sensitivity can at first easily be attributed to "bad conditions" or some problem with "the other guy" at the other end of a packet link.

If a person tries to realign the front end of the radio with this failure, he will see the receiver regain a LOT of the lost sensitivity, but never back to factory specs. If you end up working on a DVR2-2 that has incurred this failure and then has been subsequently realigned... it can be rather difficult to determine what the problem is.

Conversation with Kantronics indicates that they are aware of this problem. Suggestions to investigate an alternative part to the MPS5179 revealed that such a change would result in the need for recertification under F.C.C. type acceptance regulations which they say would be cost prohibitive.

In all fairness, their subsequently designed 440 Mhz transceiver (the D4-10) did not exhibit this failure mode and suffered no damage while connected to the same dual band antenna as the two other DVR2-2's that did fail in the described manner.

Kantronics (presently) appears unwilling to investigate a suitable replacement for the MPS5179, and I would ask that anyone familiar with this part and knowledgeable of a suitable replacement (with better immunity to damage) please make their recommendations available to those of us that presently own this radio.

In the interim, I can only suggest that purchase of this radio for use at unattended sites prone to numerous electrical storms be considered with caution.

I am looking for ideas or techniques to reduce my computer-generated
RFI over my IC-u2AT which I use for packet. The antenna and the PC are
in the same room. The only effective solutions I can imagine would be
to enclose the PC in a metal box or separate the antenna and the PC a
great distance. Neither is a practical solution for me. We ham-types
tend to be pretty creative (usu. to save a few bucks :) ...so any
ideas are welcome.

Tucson Amateur Packet Radio
1992 Tenth Anniversary
Annual Meeting

March 7-8, 1992

The tenth anniversary Annual Meeting of Tucson Amateur Packet Radio will be

held on the weekend of March 7th and 8th, 1992 at the Best Western Inn at the Airport, 7060 S Tucson Blvd, Tucson, Arizona, adjacent to Tucson International Airport. In addition to the usual presentations of the latest and greatest developments in packet radio, we plan to have some special features in commemoration of TAPR's tenth birthday.

We are expecting to have the usual "pizza bash" and other informal activities on Friday night, March 6, with the meeting all day Saturday and an open discussion forum on Sunday morning. Registration includes a buffet luncheon. The buffet dinner on Saturday is additional. TAPR will have a hospitality suite where you can gather informally, join TAPR or purchase kits and software.

Registration is from 8 to 8:30 am Saturday. Scheduled speakers at this time include, Den Connors KD2S, Lyle Johnson WA7GXD, Tom Clark W3IWI, Dwayne Hendricks WA8DZF, Harold Price NK6K.

A block of rooms has been reserved at a special rate, single or double occupancy, including full American breakfast and happy hour reception. For reservations, call the Inn at the Airport at 1-800-722-3847, or in Arizona at 602-746-0271, FAX 602-889-7391 no later than February 20 (mention TAPR to get this rate).

For furthur information, contact:

Tucson Amateur Packet Radio
P.O.Box 12925
Tucson, AZ 85732-2925
Phone: 602-749-9479
Fax: 602-749-5636

One of my co-workers, James, is trying to set up a data-massaging
program on a -386 PC. The progam is in Borland Turbo-C++.
The data originates from a sensor gadget. The data can be transferred
to the PC using Procomm. The data file, once on the PC, can be
massaged by the program in question. The desired next step is to
have the data flow into the PC and be massaged by James's program,
in more-or-less real time. He's trying to use the "bioscom" library
function provided by Borland Turbo C++. He's apparently done the
right things with data,parity,stops,baud. When he runs a little
program that calls the "bioscom" function, and prints the output,
asking for a character, the return indicates "time out" bit 15 is
set and all others are zero.

Anyone familiar with this who can give a quick hint?
As too often happens, this is a rush project, meaning it has
to work by Friday or it won't get looked at till a couple
of months from now if ever...

Send e-mail to L45JMASS@ncel.navy.mil.

Thanks..

Hello:

     I am looking for experiences of those who have worked on 450Mhz.

     A friend of mine and I need to establish a full duplex data
     link on 450Mhz. The airline distance point to point is 45 miles.

We want to set up a 9600 baud link.

Has anyone had experience on 450 with this type of distance?
What do you think would be required in antennas, power, height
etc to make a reliable link?

We have been able to make this link on 2 meters with 11 element beams
at each end. Height of about 60 feet at each end and
25 watts at one end and 50 watts at the other. This link is quite
good. However, it does not provide the speed or full duplex
requirements.

We dont want to put money into this project only to find out
it wont work, so here we are asking if you may have built
similar circuits.

Thanks in advance..regards and 73's

Steve Brant W9OBX

It seems that nobody knows that MSYS 1.13 has been out for a bit. I never

even saw a message on it from Mike (WA8BXN).
     I've uploaded it to tomcat.gsfc.nasa.gov (W3IWI's system) in
the bbs/msys directory.
     There are 2 versions of MSYS now. One has the full-blown program
with the network node, tcp/ip, and dx cluster. The other is what I
prefer to run, it's a stripped down version that has just the BBS
and K-Node in it.
     Now if we can only get him to include hostmode support.

Yes, I am searching for a packet radio terminal programm
for my Amiga.

I found something on funic.fu.fi but this are only BASIC-Programms,
and I do not like to use AMIGABASIC.

Thanks in advance,

I am very soon to order a MAC LC and 13" hi res color mon because I want
to go packet. I am Amateur Station WAOWOV. I understand how to hook
everything between the TNC and Kenwood TS-440 but I am ignorant about
what goes between the TNC and the MAC and the fellow I spoke with at
Amateur Electronics in Milwaukee, wasn't too sure what I needed there.

I will be purchasing the MFJ-1278 and I need to know how to hook to my
Mac LC. Will I purchase a ready-made cable to modify same or what?

Does anyone know if the APLINK station vk2age is still operating?
I haven't been able to contact it in some time (> 12 months).
Has it changed frequencies? I used to call it on 14077 and 14075
(mark frequencies) in the early morning (EST).

Any pointers would be appreciated.

We've run 7 watt 56 kb links longer than this, but both ends were high sites. You need to get a topo map and plot the RF path. You should calculate the first Fresnel zone for the path and look for any obstcales in the path.

If you use beams of the same *physical* size at 450 MHz, the link budget should be the same. Foliage attenuation is worse at 450 than 145, so you want to survey the path for this. If you can stay above the first Fresnel zone, this shouldn't be a problem.

NX2P created a PC board which does just this. It's called a

radio-multiplexer and PacComm sells it. If you sent NX2P a packet
or letter he might mail you the schematic or something. The board
doesn't look all that complicated. I think that it sells with cables
for between 100 and 200 US$. If you need more info on how to get
ahold of NX2P (Bill Slack) I can supply but don't have it on hand as
I type this.

Can anyone tell me exactly what compression algorithm(s) is being used by
packet BBS systems? I notice that F6FBB has compression and I believe that
there's another BBS (by a G-something but forgotten his call) that also
uses compression. I would like to implement them in my Amiga version of
the CBBS packet BBS so that it uses the same compression method as the other
BBS systems. There's no point having each type of BBS speaking a different
compression technique so that they only work when speaking to the same type
of BBS - n'est-ce pas?

First of all...can any one send me a manual for the NET/Mac software (in Mac format of course)? Binhex4, Compact pro, and/or Stuffit formats are fine. I'm using the latest(?) version from PA2AGA, 2.0 (70)...

More importantly though, I can't get the darn stuff to work right, argh... When running NET/Mac: if I try to make an ax25 connection, the ax25 windows open, the remote station is ACKing me, a friend says he is seeing my frames no problem, but I don't see anything come back and make NO connection. Anybody have a clue as to what the heck is going on? I'm about ready to burn the disk :-(If I use a regular term prog and take the tnc out of KISS mode, I can connect no problem.

My system config is: Mac SE w/ 4M ram, 40 meg HD running Sys 7.01
TNC: PK88 in normal KISS mode
Radio: Knwd TM231A

Any help would be greatly appreciated.

I recently received a packet message from England. When I looked through
all the R: header lines in the message, I noticed that all the British
and U.S. stations had used the symbol & to indicate their callsign field
whereas all the Canadian stations still used the symbol @, which I thought
was the standard symbol.
Anyone got any idea why @ is being changed to & in the R: headers?
And does this mean the syntax of the 'S' commands changes so the BBS is
given as &BBS-call instead of @BBS-call?
Thanks.

No.

  If you use antennas of the same physical size (assuming equal
aperture efficiencies) then 450 will be 10*log(450/145) dB *better*.
This is because the 450 transmit antenna gain increases which in turn
increases the ERP and corresponding field strength at the receive
antenna. Since both receive antennas have equal aperture the 450
antenna sees more signal. For constant physical antenna size, higher

frequencies are better.
  For constant *electrical* size (diminishing physical size) things get worse with increasing frequency. For constant ERP(constant TX power and constant electrical antenna size) and constant receive antenna aperture/physical size, things stay the same as frequency increases. For constant physical antenna size on both TX and RX things get better with increasing frequency. See my 9th ARRL Networking Conference paper for supporting text and figures.

  Also, foliage attenuation may actually help things if you are only marginally LOS (line-of-sight) and don't have at least a full Fresnel zone of clearance. Rolling hills and trees may reduce the reflection enough that the variations caused by the reflected signal result in only a very few dB min/max variation. A really good and flat reflecting surface can, in the limit, give you 6 dB of signal improvement over free space when phases are adding and cause completele signal cancellation when things are in exactly the wrong phase. This is the familiar "airplane fading" you may have observed on commercial TV signals. You can expect tropospheric variations to run the differential path length through all possible phases so absorptive ground clutter might actually help stabalize things.
   Of course, if the path is obstructed, lossy obstructions may severely reduce signal.

I need everyone's help. I realize that the operation of packet radio below 10 meters is limited to 300 baud, but why? Is it because of the noise and because of the small band width? This is why I ask; I have to write a

research paper in which I research a question and come up with some kind of conclusion. This is what I want to write about: What is the maximum data speed (baud) possible on the HF frequencies? Is that pretty broad? I left it open to the possibility of talking about 10 meter FM and being able to use higher rates. I don't really know where to find information for my paper. I can get the ARRL handbook (most recent or back to 1980 I believe), but I am not sure what to do. I know there is a group that want to use 9600 baud on 10 meter and are trying to get permission from the FCC to experiment. Can anyone point me to some sources for this information that would be generally easy to understand (or maybe not, I can always learn)? Can anyone answer these questions? Who knows, I may even quote you. :-)

Thanks and 73

I want to thank everyone who replied to my plead of help with Ka9q Amiga Nos.I did not think I would get this type of reply.

To the next problem. It seems everytime I try and connect to NETROM through NETROM(ex:NETROM C MSY<msy local digi>), it says it is trying to connect on the screen but the transmiter is not trying.. I checked Netrom STATUS and say nothing is transmiting but there is a session trying to connect..

Here is a copy of my startup file:

The 300 baud limit on HF data was probably selected to minimize the
flak from the CW/RTTY crowd by ensuring that the signal would fit
within a narrow CW-like bandwidth.

I would strongly encourage you to investigate what could theoretically
be done on HF if you were bound only by your imagination and the laws
of physics, not arbitrary rules and regs. I think it would be
especially interesting to see what might be done with spread spectrum.
Spread spectrum is a very powerful technique for combatting multipath,
and ionospheric multipath can be severe especially on the lower HF
bands. The FCC would probably be receptive if you asked them for a
temporary waiver of the rules, especially if it looked like your
experiments had a good chance of success. After all, this is supposed
to be at least a somewhat experimental service.

It is strange but true that in interference-limited radio
communications (i.e., just about all of ham radio), narrowband
modulation schemes are NOT necessary the most spectrally efficient.
In fact, the opposite is usually true. Narrowband modulation schemes
are inherently highly susceptible to co-channel interference, so fewer
stations can reuse the same channel in different geographic areas.

Going wideband (i.e., using more bandwidth to support the same data
rate) allows you to design modulation methods that are so much more

resistant to co-channel interference that you can actually support
more stations sending a given data rate in a given area in a given
number of megahertz.

It's a shame that the FCC rules on data are currently so preoccupied
with signal bandwidths. They should instead emphasize overall spectral
efficiency. This depends a lot more on minimizing transmitter power
than on minimizing bandwidth. But the "minimum necessary power" rule
is one that hams honor far more in the breach than the observance.

Phil

Steve, the program I use on my IBM is the best Packet terminal program
I have found. It is called "PktGold" (as seen in QST, et al). It is
produced by InterFlex System at 714/496-6639. I don't have the
address, but if you send me email, I'll dig up the address for you.

Steve

Another thing that can cause mail to loop is if the addressee is something
like:-
some.user@your.station.ampr.org

Because some.user (the user's name) has a "." imbedded in it, it can't
create the mailbox file, and gets really confused.

I'm trying to decode receptions from Dove and the UoSats.

I've managed to receive Dove (frequently and strongly) and Uosat 2 (not so frequently and strongly), and have been recording them on tape.

Unfortuneatly, I don't seem to be having any luck with the format....

Can anyone tell me, what Dove and Uosat 2/22 transmit, in what format, what tones, wether the tones are inverted from normal modem tones, wether it's ascii or not. I have a 1200 baud old basic modem that I've canabilised, and an Intelligent modem that's capable of 300/300 1200/1200 2400/2400 with BLTZ/LAPM/MNP5 (Bell or CCITT).

I've been told that UoSat 2 downloads CCD pictures, is this correct?, can anyone tell me the format?

Does anyone know the schedules for Uosat/Dove for the different transmissions.

Thanks

Gary,
  I use a Mac Si on packet. I took a Mac modem cable, which is a
  standard item, and added a 9-pin connector to make it talk to
  both MFJ and PacComm TNCs. You should be able to get the
  Mac to 25pin D cable from any Mac dealer. It's the same cable
  that runs between a Mac and a Hayes modem.

There is a public domain DOVE decoder program that will take a file of
captured data from DOVE and decode it. It's on anonymous ftp site
wuarchive.wust1.edu at 128.252.135.4 in the /mirrors/msdos/hamradio
directory. Here's the directory listing for it:

DOVE3W13.ZIP B   43150 900424 DOVE satellite telemetry decoder,files or HAPN

TRAK270.ZIP, a public domain satellite tracking program for the PC is also
in that same directory...

I've used both of these on the PC.

Well, after reading about the new Motorola MC68HC16Z1 microcontroller with DSP, I finally purchased their evaluation board. Motorola was hyping the $168.16 evaluation board was worth $500.00 in parts! How could I refuse such a deal? The ad went on to say if I finished one of the tutorial projects (all parts included), I would receive a $68.16 cash rebate from Motorola - total cash outlay of $100.00.

What kind of DSP system did I get for minimal dollars? I was REALLY surprised when I opened the large boxes. Two boxes with the following hardware and software:

- Assembled and Tested Evaluation Board with MC68HC16, Monitor ROM, and RS232 Serial Port Hardware

- Secondary LED Display Board for the DSP Tutorial (Frequency Analyzer)

- MSDOS Cross Assembler to MC68HC16 Code

- Small C Compiler (Minimal Freeware, you are expected to purchase the full-size C Compiler if you like the "trial" size)

- Books, MANY books on the IC, DSP fundamentals, and Controller Specifics

The 68HC16 is interesting as it is upwardly code compatible with the MC68HC11 series and is Motorola's high speed 16 bit control unit. Features:

- 16 Bit Architecture
- Digital Signal Processing Capability
- 8 Channel 10-Bit Analog to Digital Converter
- Two Megabyte Address Space
- Watchdog Timer, Clock Monitor, and Bus Monitor
- Two 16 Bit Counters with Seven Stage Prescaler
- Three Input Capture Channels
- Standby Ram, 1024 Byte Static Ram

Motorola is clever, allowing engineers to learn DSP by a self-study low cost evaluation and tutorial package. Hopefully, the trained person will be in a position to specify an understood chip. I was looking for a self-study package to learn DSP (having hardware, software, and building a workable frequency analyzer) and this system accomplishes this. The DSP functions is not as powerful as the 56000 dedicated DSP chip, but the completeness (10 A/D converter, timer, etc.) solves many midrange DSP functions with a minimum of external components. A multiply and accumulate unit provides the capability to multiply signed 16 bit

numbers and store the 32 bit result in a 36 bit accumulator. I think
this system would be an excellent foundation for a graduate DSP course.

Since Motorola is building and selling the evaluation board, a Motorola
dealer must be contacted (the $168.16 offer ends March 20th, 1992). My
Motorola distributor is willing to sell the systems to the net readers
for $168.16 and will ship for $10.00. Don't forget if you complete the
frequency analyzer tutorial, a $68.16 rebate will be received if the
paperwork is completed. My Motorola Distributor - Future Electronics,
 3150 West Higgins Rd, Suite 160, Hoffman Estates, IL, 60195,
 Phone (708) 882-1255 Sue or Vince Vitucci

Note: I am NOT affiliated in any way with Future Electronics, just passing
on a new introductory DSP system to my net friends.

I have made some improvements to the packet BBS/internet gateway
here at W2XO.

Formerly, you had to mail to "bbs@w2xo.pgh.pa.us" and make the first
line of the text a packet BBS "SP" line.

This still works.. however..

You can now mail directly using the "percent" style of address
like is used with BITNET, etc. If you are unfamiliar with this,
here is an example:

     w1abc%w6xyz.ca.usa.noam@w2xo.pgh.pa.us

This mails to w1abc at the packet bbs w6xyz whose H address is:
.ca.usa.noam.

The originating call is always mine using this system, and the subject,
at the moment is "internet mail" for the packet header. The entire
RFC822 header is sent, however. Also, if the address isn't understood,
it will cause a normal mail "bounce".

The message type for packet is always "P", so it won't work for bulletins.

This brings up a couple questions in my mind.
1. How do you send a "from" call in an rfc-822 header?
2. How do you specify that the message is type "T" or "P" or "B" ?
3. How do you send a BID?

X headers?

At a guess, I'd say it came through an APLINK (RTTY) gateway. Having
a limited character set, they do some funny mappings, such as # -> = etc.

A pox on anything less than full ASCII systems! (No doubt the 8-bit
people are saying the same thing about 7-bit ASCII... :-)

> of BBS - n'est-ce pas?

Very true. I have been using the SQueeze type compression for nearly 3 years
now, and would be the first to admit that there are better forms of
compression around. However, I have been working on a new protocol for
compressing up to 10 messages in one lump (using LZH compression) and
forwarding them. I got this working for the first time yesterday, so it's a
bit of a coincidence that you should ask now. I have been in contact with
several other BBS authors and those I have been in touch with have all
expressed an interest in the new scheme. What I am about to do is write down
the details of what I have got working and get people's opinions so that we
can come up with a common standard. I am willing to change what I have done,
but will point out that it does seem to work VERY well (21K of messages
compressed down to 7K, for example) and sends the minimum of data necessary.
I will put you on the list and send you some details very soon.

I'm posting this for an individual without netaccess and will relay any answers that I may receive. Here is his problem from what I've been able to understand:

Apple iie with Apple Access II software to a serial cable to a MFJ 1270b TNC. Computer is receiving packets fine. On send, able to connect to welcome prompt but is unable to send anything further past that point.

Any information would be of help in this situation. Suggestions on alternative software for this model computer would also be appreciated.

Thanks in advance...

Subject: softkiss alpha 1 / macintosh <> modem software
Message-ID: <UdeJLUC00WA1Q3QLwX@andrew.cmu.edu>
Date: 24 Feb 92 20:30:24 GMT
Organization: Special Projects, Carnegie Mellon, Pittsburgh, PA
Lines: 150

Overview SoftKiss Alpha 1 Feb 23/92
Softkiss connects a modem directly to a macintosh. This saves having a TNC. Softkiss will work with 300 baud HF, 1200 baud VHF and higher baudrates. The software is in the early stages of development and is not useful in everyday work at this time.
Softkiss is public domain and may be used by anyone for any purpose. However, please credit the author.
The author Aaron Wohl N3LIW (n3liw+@cmu.edu) has been a ham since January 1992. I write macintosh and networking software for Carnegie Mellon university for a living. Other public domain software from N3LIW 'Seer' a promiscuous mode appletalk listener and packet description language. MacMailcheck CDEV/INIT/driver to check unix mail in the background via apple's MacTCP.

Higher Level Software

SoftKiss

Higher level software

Unfortunately there isn't really any useful software above the packet level that connects to SoftKiss. The original intention was that the SoftKiss driver would emulate a TNC in kiss mode and override the port A and or port B drivers so the existing NET/Mac software would talk to it. That is not yet implemented.

NET

NET is KA9Q's software ported from the macintosh by Dewayne Hedricks. I have the current NET/Mac sources and want to add a new driver for SoftKiss. Unfortunately Net/Mac uses an antique version of think c and I have not been able to make a functioning executable. I haven't tried very hard as SoftKiss is just getting off the ground.

NOS

KA9Q is the next generation after NET. I have it compiled but not running on the Mac. I don't know how big a job it would be to get it going.

APDA AX25

I heard the APDA (apple programers developers association) has an AX25 protocol stack but haven't seen it yet.

Apple MacTCP

I do have the alternate LAP interface manual and can and probably will make a Apple MacTCP interface. Then stanford TCP/IP, finger etc will work. Hopefully Apple will allow MacTCP distribution for amateur radio use. Ham radio is a IBM-PC stronghold, it could only help to sell Macs...

Appletalk

Obviously it would be nice to access normal appletalk printers and AppleShare via radio. There are two problems. First I don't have the manual on how to make an alternate appletalk driver. I have the internal apple engineering part number and am working on acquiring it. Second the Mac is not an appletalk router. So if it was talking to the radio it would not see the normal appletalk at the same time.

Homebrew

I (Aaron Wohl) have implemented software stacks for a various commercial protocols and may make a macintosh native ax25 device driver. If you are interested in this kind of stuff read all the back issues of the networking conferences and the ax25 protocol spec.

Hardware

Basics

A modem such as the A&A Baycom modem is hooked between a radio and a macintosh.

Pinout for A&A Baycom modem

Mac Pinout Mini DIN8	DB9 Pinout Baycom	Function
1	7	DTR push to talk
2	5	MAC CTS in unused
3	4	TXD- transmit data out -
4	5	Ground

5 8 RXD-
6 NC TXD+ transmit data out+
7 NC Not connected
8 5 RXD+ / Ground

NOTE: This is *NOT* a standard cable you can buy. I asked A&A and they may carry this cable made up in the future.

Level inversion

The information for amateur radio is conveyed in the signal transitions (NRZI) not the zero or one level of the signals. What that means is that you may be able to save some gates in the hardware design by having a logic level 0 transmited come out as a level 1 and vica versa. The Baycom modem does this. It is nice to have a non inverting interface so that you can do a loopback check with a terminal emulator but it makes no difference to SoftKiss. After a packet finishes the the receive level may be left at logical zero or one, it matters not.

Carrier detect

Softkiss currently ignores carrier detect. The A&A modem I am using does not supply it to the connector so I have no way to test it. If someone wants it can work with me let me know.

RS232

The Mac uses differential input and output drivers. So it is not necessary to have real RS232. The Mac can directly drive and receive TTL. I don't have a schematic for this, someone that has details please send them. If you do want to use RS232, jade electronics has the MAX232 chips.

Homebrew modem

The 1992 ARRL handbook has a circuit with a Am7910. It is pretty absurd to use the 4 voltage supply here. Check out the DC-DC converter chips from Maxim and others. You can get data from Maxim at ???. If you use this circuit send me some notes to include here.

TAPR KN9G 9600 baud modem

I have a couple of kits and will try them out when I get the software further along. Note: TAPR is about to come out with a new 9600 baud kit. The Tuscon Area Packet radio club can be reached at ???

A&A Baycom modem

This is only modem that I have actually used. It is available in kit form from A&A Engineering for $59. It uses a single 12volt supply which is included. Be careful! the 12volt connector is the opposite polarity of most ham equipment. Stas Andrzejewski at A&A was helpful with technical questions. A&A will probable carry SoftKiss diskettes for a nominal charge.

Fullduplex

Full duplex is not possible without an external clock fed into the CTS pin. This not currently supported but can be if someone needs it. The receive clock is fed from the DPLL (digital phase locked loop). The dpll is fed from the output of the baud rate generator (BR). The BR also feeds the transmit clock. The dpll internaly divides by 32. The SDLC mode must use 1x clock. Therefore.... the buadrate is changed when switching between transmit and receive. Therefore you can't do fullduplex because there isn't a clock for the other half to use. It could also be done split across the modem/phone port [not

currently supported].
Macintosh hardware
MAC LC
Rumor has it the LC does not have the CTS wire connected. Hence it can not use an external clock or external carrier detect. [unverified]
MAC FX/QUADRA
The FX and Quadra normally have an IO processor inbetween the CPU and the SCC 8530 chip. Since Softkiss directly manipulates the SCC the IO processor must be bypassed. Apple distributes a CDEV called 'Serial Switch' to set a compatibility bit. I am looking into distributing this CDEV with Softkiss. If anyone can liberate a set of documentation for the IO processor for me...
Running SoftKiss
Future plans
Softkiss will be a device driver/cdev. It will be able able to talk to multiple programs on the macintosh simultaneously.
Current test program
The current test program is useful to see that the Mac can receive and decode the SDLC packets.   It is very crude is only a proof of concept. To use it double click on the 'Softkiss alpha 1' executable. Type in 'i<return>' to initialize the scc and interrupt vectors. Type in 'r<return>' to listen for packets and print them out. Click the mouse anywhere to exit receive mode. Type in 'u<return>' to uninitialize the scc/reset the interrupt vectors. Type in 'q<return>' to exit.
The program is availble via anonymous ftp from host akutaktak.andrew.cmu.edu [128.2.35.1] in /aw0g/softkiss1.hqx
Coming in alpha 2
In alpha 2 target date March 9, you will be able test transmiting also. I have successfully transmited with the A&A card but did not have time to packet it up. Also there will be a specification of the device driver interface so that everyone can comment.

A while back I posted a note about some mods to the K9NG modem that improved its performance. One of those mods turned out to need modification.

The K9NG DCD circuit works by using the error output of a standard state machine to dump the charge on a capacitor. In the stock K9NG modem, that's a .047 uF cap and a 470 ohm resistor. I'd advocated increasing the cap to a .1 uF, and shorting out the resistor. Turns out that makes the modem far to critical of DCD; if the state machine (which is clocked at 16x the baud rate) happens to get even one error, it drops DCD. That's not good; the modem may well be decoding data just fine at that point, so DCD should stay on.

Be replacing the 470 ohm resistor INSTEAD with a 2 K pot, you can diddle the carrier-detect for the optimum sensitivity for your radio and application. At one end (zero ohms) you'll have a real tight-fisted DCD. At the other end, DCD will be falsing on with background noise quite often. I found that the optimum setting for various of my radios is around 600 to 800 ohms, so I've been sticking a fixed 680 ohm resistor in there.

So now my recommended mod is to change the .047 to a .1, and the 470 ohm resistor changes to a 680 ohm.

>This brings up a couple questions in my mind.
>1. How do you send a "from" call in an rfc-822 header?

The standard fields (Sender:, From:, etc) all require RFC-822 addresses. If you must do it this way, I would use the user defined X headers, ie: "X-Callsign:".

Obviously you must have a translation table to go from callsign to Internet address (for messages received on packet going to internet), why not use the same table to translate the senders Internet address to their callsign for the sender's callsign on the packet message? I don't know how hard this would be on your gateway software but this seems like the

logical solution.

>2. How do you specify that the message is type "T" or "P" or "B" ?
How about "X-Type: B"? (and use to P if there is no X-Type:)
(What's type "T" used for?)

>3. How do you send a BID?
Another X (user defined) header: "X-BID: ..."

My $2E-2.

This is a long standing problem with the NETROM code in AmigaNos. For some
reason the code requires that you enter the name of any NETROM alias in
UPPERCASE, if lowercase is used it assumes that you've typed a callsign.
This is definitely a bug in the Amiga version since the MSDOS version
works just fine.

I've been meaning to send a note to G1YYH about this for some time, but
have kept putting it off (for no good reason :-))

Hi:

I need help on two technical topics. The first is for the 8530 device driver authors out there: SDLC mode says it forces a X1 clock mode, but the DPLL requires an X32 clock in NRZI mode. This seems to imply that you can't use the internal baud rate generator for both the Tx Clock and the DPLL clock sources. Does anybody have a way around this, short of an external divide-by-32 prescaler (as DRSI does) ? I guess I am hoping that I'm mis-interpreting the data book; I want to keep parts to a minimum for this particular project.

The second topic relates to AMTOR ... I've modified an XR2206/2211 modem for RTTY and AMTOR. Reading the CCIRR recommendation 476 (the definition of AMTOR as it appears in the ARRL's 3rd Computer Networking Conference proceedings), I still have some questions relating to bit-sync'ing.

What I'd like to do is create a software USART using a 68HC11

microcontroller. Unfortunately, looking at the timing diagrams for
AMTOR, the protocol is synchronous (no start or stop bits). It seems
to me that on HF it wouldn't be a good idea to assume the first valid
tone detection is good, to set the clock off that. Can someone explain
to me how this is done? Are there any code fragments available that
will help me recover the physical layer into a bitstream?

    Thanks...

Chris, WZ2B

I have uploaded the new test version of the AA4RE BBS to both ucsd.edu
and tomcat.gsfc.nasa.gov. Has a few bug fixes and also forwarding to
a file for use with the PACSATs.

With luck, this will be the last test version before 2.12 is released.

Organization: Netcom - Online Communication Services (408 241-9760 guest)
Followup-To: poster

I am conducting a survey to determine if there is interest and the extent of the interest in a direct broadcast satellite (DBS) Usenet news feed service.

The system would have the following characteristics:

Antenna size	18" or 45cm
Antenna type	Parabolic
Antenna mount	Wallmount
Data rate	9600 Bps
Modulation	FDM-V.29 Subcarrier
Demodulator	FM extended threshold
Xmit band	KU band
Satellite	GE K-2
Coverage	Continental US
Price	$1500.00 includes complete system and 1 year of service.

All news groups would be transmitted; along with requested newslists. The advantages for the users will be virtually a direct connection to the Internet for incoming news. This of course will eliminate indirect routing and associated delays. Outgoing postings will be handled through regular terrestrial methods.

Users could be Organizations,BBS operators or individuals.

The system will consist of an outside 18" antenna, mount, and satellite receiver approximately the size of a Telebit modem. The output from the satellite receiver is a V.29 signal from a standard RJ-11 female jack. The signal can then be demodulated using a fax modem as a data pump which then provides an RS-232 signal out to a computer.

This system can be used with an inexpensive XT,AT or Unix box that is readily available. This computer is setup to receive the data continuously. This computer behaves like an Electronic mail box. This mailbox would receive, buffer,and manage the data. This Email box could be interrogated by other users through the use of an RS-232 or LAN. Conventional news-readers would be used to read the news.

Some early attempts have been made in the past to distribute the news via satellite or FM radio subcarrier. These companies included Norsat, Stargate and others. These attempts were partially acceptable. However problems with copyright,slow throughput,multipath distortion,limited coverage area,hardware expense,incompatiable hardware and probably most important timing caused limited use.

If you would be interested in supporting this effort as an individual purchaser of the system or as a corporate sponsor please Email me. Other forms of support would be the software development needed to manage the incoming news for different types of computers. At this time this service does not exist however it can if there is enough interest. Please send your comments via Email to norman@netcom.com.

That is my reading of it... You can sacrifice one channel and use it as
a baud rate generator outputing a clock on ~TRxCA. The only other thing
I thought of was to run the transmit off the output of the unlocked dpll
which seemed kind of tacky.

If here any clever replys let me know. I have been working on a driver
for the macintosh and would like to support full duplex without
sacrificing a channel or adding an external divider.

Hi all,

Has anyone had any experience with the Ramsey FM transceivers?
The add says "high speed packet? ... No problem". Just how fast
is "high speed"? The price seems good enough

Several of us are thinking about using either the FX-446 or the FX-223
and the TAPR 9600 modem kit.

Thanks,

Steve I have often wondered why people go with the 232 also.
I like my KAM a lot. I can operate Packet on VHF and HF at the same
time. I run a gateway between 430 and 21 Mhz. Works great and I get
great support from the folks at Kantronics. The 232 seems to be
over priced for me and much too complicated. If memory serves me right
the 232 requires a special terminal program. I run any program I want.
I guess first you need to figure out what you want to do. HF VHF or both
and what features do you think you might run. You might just need something
simple like the MFJ 1270.
Take care and 73

At a committee meeting of the NWPUG here in the UK, a few of us were talking about the DX cluster network and I mentioned that MSYS 1.13 had DX cluster support built-in, to which the reponse was: "Its not a true DX cluster and is not compatible with the existing DX cluster network".

Are there any grounds to the above remark.

I have been wondering about the addition of compressed mail forwarding in AmigaNOS. There are quite a few F6FBB systems around me but WNOS is also running with Compressed SMTP. Does F6FBB use the same compression algorithm as WNOS?.

Cheers, John.

Danny,
     I use Packet Gold v1.26 (Aug 90) and I like it very much. From what I understand, Baycom is a landline terminal program like Procomm, et al. PktGold is a very good program that is designed (from what I can tell) for the AEA PK-88/232 TNCs. I have a copy of their "Test Drive" version, that I can send to you (or anyone else interested) who don't mind providing a diskette and postage.

Steve

I am looking for 13-pin DIN connectors like those used for the
packet connector on the back of the Kenwood TS-790A. (I am
told that the same connector is also used for RTTY on the
TS-440) Yes, I melted the one that came with the radio. I
needed more anyway for various projects. Anyone know where
I can get some?

WARNING: IF YOU USE ONE OF THE CONNECTORS, USE THE LOWEST HEAT
POSSIBLE TO SOLDER THE WIRES TO IT. THEY MELT EASILY. I KNOW
THAT I'M NOT THE FIRST TO DO IT.

Thanks,
John N4SMX

The PMP article (August '91 of 73 magazine) confused me when it
discusses the connection to an HT with "Icom style HT keying."
Evidently, the Icom does not use a separate line for PTT. What is
the alternative? What does the DJ-F1 use? (The DJ-F1 schematic
doesn't make it clear to me.)

What are the connections between the base station configuration for
the PMP and the microphone of the Alinco DJ-F1 HT?

    This is the sub-mini plug that goes from a separate microphone
    into the DJ-F1 HT. Should I use a similar plug and wire the
    PMP into the DJ-F1 this way?

Tnx

I have an apple cat modem for the apple II that supports Bell 202. I was wondering if this could be used to rec. packet radio with the proper software, or what would I have to do to make it work. I tried pumping packet audio into it but didn't get anything interesting and from a different post I saw that packet doesn't have stop and start bits includied which of course the modem does. As it would be an easy modifcation to feed the 'raw' decoding into the computer, what do I have to do to unravel the Hdlc(?) code and would it be worth the effort. I have seen a break down of the internals, but most of the pacekt books I have seen just tell how great packet is and how to connect to a bbs or another user with a TNC, not what it takes to 'make
what it takes to 'make' a TNC.
One last question, since I would have to write the software, I am really more intrested in getting into TCP/IP stuff. How does this change my work load? What I am looking to do is to do very little work on the apple and send it to the ibm to do the real work. Is this a workable solution?

-Mark
-N0CCQ

-=-=-=

Can the state machine on this TNC be modified to generate a
DCD? The DCD generated by the XR2211 is too `noisy' when
used with the radio's squelch open.

The MFJ1270B TNC employs an EPROM based finite state machine
to perform clock recovery. The EPROM is (C) 1985 Systek State 1.09.

     - thanks

Dear Friends!

I am a poor little French students that discover the packet-radio digest
and found it very exciting. In my country, we don't use like a method to
contact us: the Minitel' videotex system (X25) is the most familiar one.

Could you please writte me if I can make something in your field in   my
country?

Thank you very much for your kind help.

Good old TAPR produces digital state machines for these TNCs that plug
into the modem chip socket, with the modem chip relocated to the daughter
board. They do an excellent job of supplying an accurate DCD with an
unsquelched radio. Prices from $11 to $17.50 depending on TNC model.
Your's is the cheap one. Call Heather at 602-323-1710 for more info.

Yes you can do this, though it probably isn't worth the effort. The old
GLB TNCs did HDLC by bit banging as does a software package for the PC
called PMP, or Poor Man's Packet. The entire AX25 spec is published by
the ARRL complete with all the state diagrams you need to implement it.

>   One last question, since I would have to write the software, I am

This is certainly easier. All you have to do is implement the KISS
protocol instead of the entire AX25 TNC system with it's link states
and user interface. You'll still have to implement the bit banging to
generate the HDLC though. It should make an interesting assembly language
exercise on the old Apple, but remember that a completely functional TNC
can be purchased new for $120 and used TNCs can be found for much less.
If you're really serious about TCP/IP, there are internal bus cards available
that will allow you to operate at the higher speeds that are becoming
popular for mass data transfer such as the Gracilis card, the PI card,
and others. These will work up to at least 56 kilobaud. There's no way
you're going to be able to bit bang much faster than 1200 baud.

Content isn't the problem. As soon as you start routing using IP
the callsigns of the originating station and the destination
station don't appear in the packets. (IP addresses arn't valid
identifiers) BBSs are a problem because DoTC can't distinguish
between a packet and a message. (Whats the difference?)

They don't actually. The whole mess of regulations was mainly
intended to make it easy for them to spot transgressors.
Unfortunately it only makes it easy to spot the people operating
legally. :-(

>>> It's a shame, ain't it... Have a look at the wonderful LANs they've set

> Please do - I'd like to know how other states are going.

Ok.
Please note this is only what I have heard. If anyone has details
other that what I type I'd appreciate the correction.

Australian Capital Territory.
Most activity on 147.575 Mhz at 1200 baud. 2 BBSs, one AA4RE and
the other APLINK (it's also on 40m) Some TCP/IP. Some activity
on 144.800 Mhz at 4800 baud. (My BBS is there too) Local digi
running TheNet NET/ROM on 144.8, links to Sydney and, shortly, to
Mt Stanley (VK3).
Local Organisation: Canberra Amateur Packet Radio Group.

Victoria
Numerous freqs in use throughout 144.7->144.950 and a couple at
147 Mhz. Several BBSs all running W0RLI and BPQ.
A state digipeater network is mostly up and running but only at

1200 baud. Most sites run TheNet NET/ROM. 9600 baud full duplex link from major Vic BBS (VK3BBS) to Wormhole. 9600 baud links between digipeaters is planned and the first one should go in sometime this year. A fair bit of TCP/IP activity, mainly clustered on a separate frequency although some linking via the net/rom network takes place.
Local Organisation: Melbourne Packet Radio Group.

Queensland
I've got bugger all idea what they're doing up there except I've heard rumors they are putting in TheNet Net/rom. Several BBSs around Brisbane, all co-operatively set-up on separate freqs etc. Apparently it's quite nice. Some other BBSs around the state. I've got no idea what TCP/IP activity there is.
Local Organisation: QARDAT (I've got no idea what it stands for! :-)

South Australia
Apparently they have some ROSE nodes. I've got no idea who they're talkling to though cause they currently can't talk to Victoria. There is some movement towards a net/rom network. (There my even be an operational node there now. My info is a bit old) At least 2 BBSs. Some TCP/IP activity.
Local Organisation: ?

Western Australia
I've only heard things third hand about WA (Perhaps Ron Murray can enlighten us?). There is only 1 ROSE node and a few digipeaters. Several freqs are used. (Not sure what though) I've had enquiries about 4800 baud modems (the CAPRG Tri-speed modem) and rumours they are looking at net/rom. AAPRA had a ROSE link via kind sponsorship between Perth and Sydney. I'm not sure it's still operating.
Local Organisation: ?

Tasmania
Who knows?

New South Wales
Two separate networks operating.
First network is sponsored and run by AAPRA and is based on ROSE. System employs a UHF 1200 baud backbone on 440.050 Mhz. (1 BBS as well I think) Covers Sydney and some outlying areas. It used to link to Perth. (Is it still working?)
The second network is mostly sponsored and run by private individuals although some clubs are now jumping on the cart. It's a 1200 baud single freq net/rom network with some 4800 baud 144.800 Mhz links. It currently covers Canberra -> Sydney plus might be some northern links by now.
Several BBSs, mostly running either AA4RE or MSYS on quite a number of frequencies around 144 Mhz (and the usual 147 Mhz ones). Some TCP/IP (although I don't know how much).
Local Organisations: Australian Amateur Packet Radio Association

(AAPRA), Sydney Amateur Digital Communications Group (SADCG),
Some other AR clubs. (Manly-Wahringa, Central Coast etc)
[Perhaps someone in the Sydney area would like to elaborate?]

Department of Transport and Communications and the Wireless
Institute of Australia.
The WIA is drafting some "deregulation" proposals to be submitted
to DoTC regarding, amongst many other things, deregulation of
packet radio. This process is well under way.

Well Mark, is this what you wanted? :-)

Carl.

Actually I do remember some things. There is at least 1 BBS
(VK7BBS) and a couple of digipeaters. 1 digi is right up in the
central mountains and covers most of the state. Occasional
contacts with VK3 and apparently VK3 is looking at how they can

link to VK7. Interesting if it works. :-)

Carl.

I think another problem you will have is that the bits are encoded
in NRZI format, not NRZ. You'll need to program your usart for this
coding (if it can do it) or externally convert NRZI to NRZ.
I don't think simply connecting the modem up to a serial port at
1200 baud will give you anything but garbage.

==========
USING THE NOS "DIALER" COMMAND
TO INITIALISE YOUR TNC
==========

by Ian Wade, G3NRW @ GB7BIL
26 January 1991

I usually run my TNC without a RAM backup battery, so it is necessary to re-initialise the TNC every time I start NOS. The NOS "dialer" command provides a convenient way of doing this automatically. The filenames in the description that follows fit into the file organisation used by "NOSview".

The first job is to prepare the dialer file:

```
-------------------------- Cut here ----------------------------

# N:\SCRIPTS\DIALER\TNCINIT.DIA

control down
control up
speed 4800
send "*"
wait 200
send "*"
wait 200
send "*"
wait 200
send "*"
wait 200
send "\r"
send "MYCALL NS9BOB-5\r"
wait 1000
send "MID 84\r"
wait 1000
send "KISS ON\r"
wait 1000
control down

-------------------------- Cut here ----------------------------
```

The function of the script is as follows:

1. Send out a string of asterisks to let the TNC autobaud.
2. Set up the TNC with MYCALL.
3. Set up the Morse ID interval;
            ("84" means 840 seconds; i.e. every 14 minutes)
4. Set the TNC into KISS mode.

The "\r" in the commands means carriage return.

The "wait" times are in milliseconds, and give the TNC time to
respond to the commands.

Add any other commands you may need to initialise your TNC, with
a "wait 1000" after each.

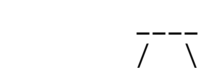
The next step is to include a call to this script at NOS startup
time. Place the following lines at the end of "AUTOEXEC.NOS":

```
-------------------------- Cut here ----------------------------

# Initialise the TNC into KISS mode
dialer tnc0 /scripts/dialer/tncinit.dia

-------------------------- Cut here ----------------------------
```

Thus when NOS starts up it will initialise the TNC. You will see
the commands echoed on the screen, together with the TNC
responses.



When the script is done, the display freezes for 10 seconds (this
is hardcoded in the dialer; there is nothing you can do about
it), then the screen switches to the session manager prompt
"net>". The TNC should now be ready for use.

(If you only see the dialer start and dialer end messages, with
nothing echoed from the TNC, it's probable that you are already
in KISS mode. In this case give the "param tnc0 255" command to
reset the TNC to native "cmd:" mode, then try running the dialer
script again).

This procedure has been tested using PA0GRI NOS version 1.8b
(KA9Q 1229) with a PK88 TNC and works fine. With suitable
modification it should work with any TNC. If you have
difficulties, please feel free to contact me.

For the uninitiated, Is there something available which
explains the features of the many derivative versions of
nos? It appears that all begin with ka9q.
This question comes after browsing the ucsd.edu files
and not wanting to waste time, cost on getting everything
but just would like know what are the items that make each
version different.

I do not believe that this is in the FAQ.

As our newsfeed has been lousy lately, please email.

Thanks to the net,
73,
Jim

Can you help? I am having problems with NOS 911229 (PA0GRI
v1.8b) talking to a PK88. The PC is a Commodore C286-LT
notebook. All 9 pins of the PC COM1 connector are connected to
the PK88.

When I start NOS, RTS and DTR stay low, and so the PK88 refuses
to send information back to the PC. If I momentarily remove the
PC-to-TNC cable and then replace it, RTS and DTR then go high and
everything works OK thereafter.

This problem does NOT appear when I use a Dell 310 as the PC.

Neither does it appear on either the Dell or the notebook with earlier versions of NOS (e.g. NOS 910618 - PA0GRI v1.7j). In this case, RTS and DTR are low when NOS is not running, they go high when NOS starts, and then go low again when exitting NOS.

In other words, it looks like the notebook UART does not communicate properly with NOS 911229, but is OK with earlier versions of NOS. Unfortunately I don't know what type of UART is in the notebook.

Is this a bug in NOS 911229, and is there a workaround?

I've had problems, too. I'm not sure they're related to the Baycom board itself, to the TNCs parameters, or to my equipment. I suspect the latter. I'm using an Alinco DJ-F1 HT with the board. I've checked and double checked my assembly (I'm an experienced kit builder), and it seems fine. I've varied the transmit-delay parameter (time between PTT and modulation) as well as the tail parameter (time between end of transmission and PTT off) to no avail. The defaults work just as well as anything else I've been able to come up with. I've also played with the output level potentiometer and with the HTs volume control and have found settings that work -- sort of.

If I'm not mistaken (I'm kinda new to packet), packet modems transmit on 1200/2200 HZ. I've been told that some radios have limited frequency response and may be rolling off around 2200HZ. The 7910 chip used in the Baycom modem is apparently sensitive to having these two tones coming in with similar amplitudes. If, as I suspect, my Alinco DJ-F1 is rolling off at 2200HZ, then this may explain my problems. In order to compensate a bit for this, Baycom has provided a swithc on their boards which can put the modem in VHF-enhanced mode. In this mode, which affects receive only, the modem attempts to compensate for a 2200HZ tone of slightly reduced amplitude. Unfortunately, in my case, it appears to be insufficient to cure the problem.

Until I can get another radio to try my Baycom modem on, I'm going to have to assume that my Alinco HT is causing me problems. I wonder if other manufacturers TNC products (MFJ, AEA, etc) have the same sensitivity problem the Baycom does. Anyone using an Alinco DJ-F1 HT with packet care to comment?

I should mention that when I listen to voice on my Alinco DJ-F1 and compare it with my scanner tuned to the same frequency, it is pretty obvious that the sound coming out of the DJ-F1 is a bit more bassy than the scanner, so this sort-of confirms my theory. I guess I'll need a white noise generator and a scope to really check things out.

If anyone has anything interesting to add to this discussion, please send me a copy via email in addition to posting it. I don't always get to read news before it expires around here. Thanks.

I was wondering how/if I can get a hold of some information about things
to do with packet. I have just built a TNC (pmp) and have the local BBS
pretty much down (reading and sending messages). But there has to be more
to packet! right?

Is this a FAQ? If so how do I get the list of answers?
If not are there any good sources of info?

All help would be appricated!
Thanks!

Well it seems that I jumped the gun with this one. After rebooting the
machine the nos 2.0a code stopped working. Same old song and dance, it
talks but doesn't hear. The packets get buffered up inside the PK-88

and I have to use tip ax0 followed by ^C^C^C to get them flowing. Even
then they only flow while the TNC isn't in kiss mode. As soon as the
kiss on command is given it freezes up again. The nos code just isn't
turning on RTS and maybe DTR. Going to command mode forced xflow on so
the TNC doesn't care about the damn handshaking lines.

Can who ever it was that changed the asys driver from what it was in
pa0gri nos 1.7j to what it is now 2.0a please fix the damn code. The
1.7j version is the only reliable asy driver version available.

Using kermit with set flow rts works fine even in kiss mode, so the
TNC is working fine. In fact if I run nos and kermit in DOS windows
and switch back and forth enough times it tricks the code into working.
If I stop nos and restart it the problem returns. Something just isn't
getting set properly.

Last night the PK-232 even had problems working from a cold start. I
guess I must have tested things in "right" order last night when it worked
right for awhile.

Oh well back to 1.7 again, for the third time.

Mark

If you can get it to an anonymous FTP site in Europe, I could fetch it and
put it on a few appropriate NA sites (e.g., tomcat.gsfc.nasa.gov and ucsd.edu).

>By the way, is the T type message still used in the USA (or anywhere else)?

>It's not used in Europe, so my software doesn't support it. If there is an
>interest in using my software over there, and T messages are needed, then I
>will have to look at making some changes.

Yes, type T for NTS (National Traffic System) is widely used in the US and
Canada. Support for type T is also lacking in the F6FBB software, but that
doesn't seem to have stopped it from becoming quite popular over here. In
general, only one BBS in a given area needs to have special handling for
type T (but all should at least support forwarding type T in the same manner
as type P), so I suppose that's how folks work around the problem.

The main requirements for type T handling are support for the commands ST,
LT, and KT. Type T message headers are normally made visible to all users
who use variants of the plain L command (whether that's a good idea is
debatable) as well as being singled out by the LT command. Type T messages
are readable by any user, and killable by anyone using the KT <msg_no>
command. Perhaps it would be better that the ability to read and kill
type T messages be restricted to users who are granted permission to do
so by the sysop. I don't know of any software which supports such
permissions, so I surmise that it hasn't been considered very important.

I have the same problem with all versions after 1.7j. The handshaking
lines don't get raised properly. Nothing is sent from the TNC to the
computer. I am using a PK-88 and an IBM PS/2 P70 (the portable).

1.7j works fine and the UARTS are 16550As.

Thanks,
Mark

Standard packet is 1200 bps NRZI Synchronous HDLC, which you probably
aren't set up for. You'll have to recover the clock, and perhaps turn
the NRZI into NRZ to use cheaper SIO chips, etc. While you can do this
with basically two parts (a Prom and a Latch to make a state machine),
it'd be a LOT of work to then write the software.

Considering that used TNCs go for $35 to $50 at swapmeets, it shouldn't
be that hard to save up for one. Or hock your grandmother.

Here's a quick note for anyone compiling our AX.25 IP
streams module for SunOS 4.1.1.

The file "ax.h" is missing from the .shar file on ucsd.edu.
(ucsd.edu:/hamradio/packet/ka9q/incoming/sunos_ax25ip.shar)

ax.h contains one line specifying how many ax25 interfaces

you want to have available. It can be between 1 and the
number of serial ports on your machine, inclusive.
For example:

```
% cat /usr/sys/sun3/AX25_KERNEL/ax.h
#define NAX 2
```

Also, when making telnet connections to other stations at
1200 baud, it's a good idea to switch to line-by-line mode,
rather than use the default character-at-a-time mode.
This reduces packet congestion, as well as allowing
lines to be edited before being sent.

Could someone tell me where I can find AmigaNOS 2.8p or later.  I looked
on ucsd.edu and 2.8m is the latest and I cannot access Mr. Heaton's
machine from my site.  2.8p is the latest I have heard of (I'm still
using 2.7) and I'd like to upgrade as few times as possible.  I'm only
interested in the executables, not the source.

Did they really expect people breaking the law to do so under their
own callsign? :-) [I've seen several "packet pirates" about, and alas
have been the victim of one or two.]

>Local Organisation: QARDAT (I've got no idea what it stands for!

Uhhh... Queensland Amateur Radio Data And Teletype (or some such).

>South Australia
>Apparently they have some ROSE nodes. I've got no idea who
>they're talkling to though cause they currently can't talk to
>Victoria.

VK2 I think, via HF.

>New South Wales
>Two separate networks operating.
>First network is sponsored and run by AAPRA and is based on ROSE.
>System employs a UHF 1200 baud backbone on 440.050 Mhz. (1 BBS
>as well I think) Covers Sydney and some outlying areas. It used
>to link to Perth. (Is it still working?)

Yes - at least, when RWI stays up long enough to beam to RPA (thence
to the land-line). We've had trouble with the UHF rig.

>The second network is mostly sponsored and run by private
>individuals although some clubs are now jumping on the cart.
>It's a 1200 baud single freq net/rom network with some 4800 baud
>144.800 Mhz links. It currently covers Canberra -> Sydney plus
>might be some northern links by now.

I didn't know VK2 had a network :-)

>Several BBSs, mostly running either AA4RE or MSYS on quite a
>number of frequencies around 144 Mhz (and the usual 147 Mhz
>ones). Some TCP/IP (although I don't know how much).

A couple of W0RLI ones as well, such as RWI running as a BPQ node.

>Local Organisations: Australian Amateur Packet Radio Association
>(AAPRA), Sydney Amateur Digital Communications Group (SADCG),
>Some other AR clubs. (Manly-Wahringa, Central Coast etc)
>[Perhaps someone in the Sydney area would like to elaborate?]

That about sums it up. Basically, an unorganised shambles, although
the situation is improving.

>>"...there has to be more to packet, right?...."

Steven,
In my experience, packet is mostly divided into three areas:

1) reading BBS messages, writing a few
2) keyboard to keyboard QSOs
3) setting up and running a BBS and/or network station

#3 takes a lot of time and money committment. Furthermore, depending
on your local conditions, you may encounter a lot of resentment from
the established operators who see you as competiton or interference

to what they have

There is one other field of endeavor: writing software for packet.
That is another MAJOR undertaking.

(For background, I operated the main BBS and traffic forwarding switch
in this area for a year or so.)

What is the proper way to get a TCP/IP (internet) address, for use with
the KA9Q software on packet? I presume there is some form of coordination
carried out.

(NB. I'm in France, that may make a difference to the answer)

Thanks

Steve

In a conversation the other day on the local 2m repeater, I was referred to the New England Digital Association as a source of good information on packet, TCP/IP, and other activity in the New England area. Unfortunately, the person I was talking to was mobile and did not have address or contact info available.

What is NEDA about? How much does it cost to join? What are the benefits of joining? Who can I talk to about joining? Is there an address (packet or Internet e-mail) to which I can send a query?

Please send mail to me directly at jmccombie@bbn.com or N1ILZ@WA1PHY.#EMA.USA.NA. I'll summarize on request.

[Note: if you're outside of New England and reading this, sorry...I'm trying to restrict distribution to only New England, but I've heard tell that such restrictions don't always work.]

Hi there,

I am a final year degree student currently working on host software to drive a PK88 TNC. The software would enable PC users to have an enhanced mail box as well as configuration and help tools. I am intending to port the final version to MS windows if there is sufficient interest. So, does anyone want a flash terminal emulator for their PK88 under MS Windows ?

Depending upon the interest (if any) I'll try to get it uploaded to SIMTEL and the like.

Also, I'm working on a document outlining current packet radio technology. It currently covers bit and pieces on the early days (including Phil K.'s stuff) and some bits I've gleaned from this mail list. If you were going to write something like this, what would you include?? Sorry, if it sounds like I'm fishing for ideas, but I wanted to be sure that any new and interesting stuff,

like high speed backbones, DCD state m/c and PacSats, were not left out.

Thanks in advance,

73's

Darren

>
> Is this a bug in NOS 911229, and is there a workaround?

   The 1.8x code used new drivers which have RTS and DTR set low on startup
(this is tied up with dialler code. I think). Anyway, try adding the following
to your autoexec.nos:

param ax0 DTR 1
param ax0 RTS 1

(replacing "ax0" with whatever interface name you supplied in the attach command). This will, of course, have to go AFTER the attach command. My system was a bit weirder than simply not working: without DTR set high, the TNC radiated broadband noise for some reason. I would suggest that you add these lines to your autoexec.nos even if you're not experiencing any problems.

As the subject says. I can not compile this version of KA9Q, as well as
subsequent version (of 1990), since in audit.c it uses
external int Uend,_STKRED;
Borland TC2.01, TC++1.0 ate it (Although I failed to found in the manuals
this keywords), but since BC++ 2.0 during link I get unresolved names -
_Uend and _STKRED.
If somebody knows of this (presumably heap/stack management in TC), please
inform me.
       Thank you,
            Mike

Are any of you using a Yeasu FT-23R for packet? How involved are the mods?

Thanks,
Mike AA7JF

1270B TNC (from MFJ) and are using the FAX part of the TNC.

If you are, what kind of software are u running? I run both hf and vhf packet
and would like to try the FAX part of the TNC.
Where can a Tech+ operate with this?
Thanks and 73's/DX

Does anyone know if HOST mode protocol is standardized on different brands of
TNC? That is, is HOST mode on Kantronics, PK-232, MFJ, etc all compatible?
I was discussing this with the guy who runs the local packet BBS and
he seems to think it is all the same. I'm not convinced. Anyone have any
info on this?

Definitely not. Even different TNCs from the same manufacturer are
not compatible (KAM vs DE). As an aside, I will be supporting
Kantronics host mode some time this year. My hope is that I can
convince my BBS program to use AMTOR thru the KAM and AX.25 on other
TNCs simultaneously.

Sadly, no. Aside from BBSing, keyboard chatting, file transfers, and
PacketCluster DX spotting, there are very few real *applications* of
packet technology widely available in amateur radio. None of the current
packet software packages support arbitrary application programs over
the network. Most of the software writers seem to be engaged in a game
of oneupsmanship in the areas of BBSes and mail handling in general
rather than in writing tools for transparent access to the network
by application programs.

Of course the physical packet network is in such a primitive state

that little can be accomplished with arbitrary applications at present,
so perhaps it's a moot point.

Fertile areas for packet applications are remote control and telemetry,
multi-player games, database access, and distributed computing. Most
await a clean, standard, network API and higher speed channels.

Ahem.
Although I *should* just tell you to RTFM, I'll pass on this information
anyway, knowing that it might help cool the tempers here.

Add the following commands to your autoexec.net file:
param <interface> dtr 1
param <interface) rts 1

This will enable the handshake lines.

  Where are the complete docs to AmigaNOS (or an Amiga-compatible NOS)? I have a friend running NOS on an IBM connected to our local University. I don't have a radio let alone a TNC. I would like to find a way of linking my NOS to his by his modem (2400) and then I can link out of his TNC and on to the internet. I've been on the internet in this fashion for quite some time and I am resonably knowledgable in netowrking but sometimes clarification off the AX.25, SLIP, NFS etc... can be quite helpful. Is what I propose possible? (I would hope so, that's what NOS is all about isn't it?) NOTICE MY CROSSPOST TO REC.RADIO.AMATEUR.PACKET for this article. For R.R.A.P readers without headers, this article thread originated in comp.sys.amiga.datacomm.

73

PS. If there is anyone who can offer longish-term help with AmigaNOS by e-mail, please reply to my address.

Subject: UO-14 operations moving to UO-22.
Message-ID: <Ns5qFB2w164w@inqmind.bison.mb.ca>
Date: Thu, 06 Feb 92 18:01:10 CST
Organization: The Inquiring Mind 1 204 488-1607

The following may be of interest to anyone who is planning to get
into 9600 baud packet satellite stuff. It will be of intense interest
to those who might be thinking about buying a crystals for UO-14
in the near future. This is from UO-14.

*** Amateur Radio Operations Move from UoSAT-3 to UoSAT-OSCAR-22 ***

3 February 1992
University of Surrey

In late December, we introduced an enhanced broadcast server on
UoSAT-3, which did a lot to reduce congestion on the satellite's
single uplink; now we have another bottle-neck. Because UoSAT-3 has
only 256 kBytes of program/data memory, we are using a RAMDISK which
can only hold 400 messages at a time; with uplink contention reduced,
gateways on line, and more than 150 stations regularly active, this
400 message limit is often exceeded. When the satellite is full, new
messages cannot be uploaded, and older messages have short lifetimes
(before being deleted automatically to make way for new messages).

The large population of amateur radio stations on UoSAT-3 is also
somewhat limiting for the non-amateur stations which get only very
small access windows (roughly 1:5 of the opportunity given to amateur
stations). The brief bursts of transmission on the non-amateur
downlink interrupt amateur activity and also make it difficult for
automatic frequency control circuits to operate on the non-amateur
downlink.

In addition to UoSAT-3 (OSCAR-14) the controllers at Surrey have
UoSAT-5 (OSCAR-22) as a potential resource. SatelLife - the
organisation which paid for most of UoSAT-5 - had planned to operate
the satellite predominantly on non-amateur frequencies. Operation of
the CCD camera on the amateur downlink was to be a "secondary"
activity of UoSAT-5.

After launch, this plan has run into two difficulties: The UoSAT-5 CCD

camera has proven very successful, and amateur radio stations around the world are downloading the images of the Earth; images are taken several times per week, and each is more than 300 kbytes of data. Furthermore, UoSAT-5's high power amplifier which has produced excellent output on the amateur frequencies - does not work reliably on the non-amateur frequencies.

Taking into account the resources available to us and our obligations to SatelLife and other organisations, we have decided to take the following steps to optimise our use of UoSAT-3 and UoSAT-OSCAR-22:

1) All non-amateur traffic, both SatelLife and VITA will be carried on UoSAT-3, which will cease to transmit on its amateur downlink.

2) All amateur traffic will move to UoSAT-OSCAR-22, and UoSAT-OSCAR-22 will operate as a dedicated amateur radio satellite transmitting constantly on its amateur downlink.

Of course, there is a price to pay for this transition: Most notably, the conflict between CCD users who want to download large CCD image files and "BBS" users who just want to get their mail. We are looking into on-board JPEG compression for the images, and this potential disadvantage will be balanced by the following advantages:

- 512kBytes of program memory permitting 800 message capacity

- two amateur-radio uplinks : 145.900 and 145.975

- no downlink frequency switching (permanently on 435.120)

** THE BIG SWITCH **

The UO-22 file server is now enabled, and we recommend that all new messages be uploaded to UO-22 and not to UoSAT-3. The UoSAT-3 FTL0 server will be disabled sometime on Wednesday, February 5, and UoSAT-3's amateur downlink will be turned off. I apologize for the short notice, but there is engineering work on UO-3 which must be done this week, and there hasn't been enought time for a more gradual transition to be publicised.

Hey gang,

This seems like a strange cross post, but bear with me. I have found a company which has some Tandy Model 6000 Xenix boxes they are replacing. They all have multiple serial ports, between 1 and 4 megs of memory, and one even has an 80 mbyte harddisk. They all have the O/S and several business applications. None, unfortunatly, has a development system. I'm thinking of proposing the company donate the machines to the local packet radio group for use as TCP/IP nodes using ka9q or something similar in a yet to be built local network. My first question, was a development set ever available for these things, and am I likely to be able to find one these days? If I do find one, will I be likely to get any recent software running? Second, are they even worth the trouble. I see them as analogous to a Volkswagon unix box. They would be better than nothing, but only if I can get them free. Am I off base in that assumption? Finally, assuming it even makes sense to think about using them, does anybody have any suggestions what configuration we should put them in?

Just for my own information, can someone tell me more about the machines. All I know is that they are an MC68000 based system with SCO Xenix 2.??. The person I spoke to thought they have an 8 MHz clock, but he wasn't sure. His opinion was that they are dogs and is glad his company is replacing them. Unfortunatly, he isn't a computer weenie, so he didn't really have many answers.

Thanks,
Michael

Actaully, TAPR sells 3 DCD kits. The first is the one Gary had in mind which
is for the TNC-2/clones and consists of a header that fits in the XR2211
location, and the other 2 are the state-machine units that have an eprom
and a handful of other chips on it. The pricing was $15 for the TNC-2
DCD, $20 for the State-machine for TNC's with hardware HDLC, and $25 for
the State-machine for TNC's without a hardware clock (the State-machine has
its own clock)

I am currently contemplating purchasing an AT&T 3b1 Unix PC and would
like to find out more about N3CVL's NOS.

  Is anyone running N3CVL's NOS on a 3b1?
  If so, did you have any MAJOR problems compiling it and getting it to
run on a 3b1?   Is it too aggressive for Amateur Radio TCPIP?
 Does N3CVL's NOS use the UNIX sendmail and rmail programs or does
everything run in one program (like NOS on a PC, or an Amiga)?
(I'd like to run a UUCP to tcpip gateway, which would be much easier
if NOS also uses sendmail and rmail).

When one telnets to a UNIX box running N3CVL's NOS, is it possible to
actually log in and get to csh (or sh) or does one only get into a
mailbox program ?

What is the newest version of N3CVL's Unix Nos? Where could I ftp

N3CVL's Nos from?

Are there any other packages that would work on amateur tcpip available for a
3b1 that are public domain/shareware?

Thanks for this and any other info you might have about using a 3b1
for amateur radio tcpip.

73/55

Why is IP routing treated differently to third-party traffic? Surely the
former is just an automatic version of third-party.

Because it's done without operator intervention. (I think) It's
the same problem we have with things like NET/ROM etc. Packet
repeating/digipeating/networking is taken as if we were
individual repeaters. Initially DoTC (or DoC as it was then)
wanted to prohibit all digipeating except for licenced
"repeaters". Luckily we got that squashed. :-)

To put it bluntly, ROSE is dying within Australia. Not because
of it's technical problems though, mostly because of politics and
personalities. (Although I think ROSE hase severe technical
problems as well)

Carl.

I have recently obtained a Heathkit HD-4040 TNC with the WA8DED ver. 1.3
upgrade ROMS. I also have an ICOM-32AT that I would like to interface it to.
What I need is the diagram and or spec's on how and what components needed.
The IC-32AT has an earphone jack, and a mic jack. I was told that I need to
run both TX Audio and PTT to the Mic jack, but, alas, lask of docs....
any help would be appreciated..
Also, I am postion this through Pnet 01, and I don't see a direct topic, is
there one, or is sending a message via this method the only way?
thanks for any help.

Steve Zerbe   KA4YND- Ready to upgrade NOW !!!

I am returning to amateur radio and packet after an absence of several
years. I would like to set up a system using nos and have several
questions. If there is a FAQ on the subject, I would appreciate someone
pointing me to it, otherwise here are the questions:

1. Where can I get the latest NOS code via phone BBS (we have no FTP
    access to Internet)

2. Can I get KISS proms for my pk80? From TAPR?

3. Where are the FAQs for packet.

4. How do I get an IP address (S.E. Michigan)?

Thanks

Bill

Date: Tue, 11 Feb 1992 14:10:24 GMT

I recently got my homebrew Baycom circuit running and thought that I would share a few of the trials that I experienced in hopes that it will make it a bit easier for others to start up and get on packet.

1. In the troubleshooting section, they refer to the "flashing square". You must realize that the flashing square that they refer to is after you start up "L2.EXE". You should see the flashing square in the upper right corner of your screen, with the DOS prompt still on the screen. The "L2.EXE" is a TSR (Terminate and Stay Resident) program that operates as the TNC (Terminal Node Controller). The other program "SCC.EXE" is the terminal program that displays the packet information to you. When you start the program by using the batch script "BAYCOM.BAT" this first starts up the "L2.EXE" then starts the "SCC.EXE" program.

   You can leave the "L2.EXE" program running and decoding packets, while you continue to use your PC for other purposes, such as word processors, spread sheets, etc., as long as there is sufficent RAM for them.

2. This leads me to another caution. When you do get the BAYCOM running and use the PC for other programs while the L2.EXE is running, if the BAYCOM is running on Port 1, you should avoid using Port 3 if you have it on your system (for a Mouse, communications modem, etc.). The same goes for running BAYCOM on Port 2 while using Port 4 for other purposes. As I understand it, the system shares interupts between Port 1 and 3, as well as 2 and 4. This contention could cause your PC to crash periodically. Another solution is to remove L2 from RAM using the "OFF.COM" program.

3. I also ran into problems with the voltage regulation thru the 78L05 voltage regulator. I only had about 6.5 volts at the input to the regulator, thru the diodes from comm port 1 of my PC. I later found that port 1 gave me sufficent voltage. I haven't verified it yet, but I beleive that that port may be somewhat faulty. If I provide an external voltage, port 1 works, and all diagnostics that I have tried indicate that it is working OK, but it just doesn't provide enough voltage to run the BAYCOM circuit.

   I even tried using a resistor and 5.1 volt zener to supply the regulated voltage, but after finding that port 2 worked, I put the 78L05 back in.

   You may be surprised to see -.6 volts on the circuit before the L2.EXE program is started up (which initializes the port), but this doesn't appear to hurt the circuit any.

   If you can't find an LM78L05 voltage regulator (I had difficulty) you

can also use an LM2936 which also has a low quesent current.

4. If you get the circuit connected, with 5.0 volts to the circuit, but still don't decode the packets, you can open the squelch on the radio. The upper line of the Terminal Program (SCC.EXE) should indicate that it is receiving by the "RECV" on the far left end, just under the Transmit window (upper window). If you don't see this RECV indication, then you don't have any signal thru the modem chip. Trouble shooting from this point will require something to indicate if you have a signal thru the modem chip. An oscilloscope (even an old 5 mhz) is ideal, but you may be able to get by with a frequency counter, or a DVM on the AC range. Again, open squelch and verify something of an AC signal at Pin 8 of the TCM 3105 chip. This is the recieve output form the Modem chip. If this is present, follow it to pin 5, then pin 6 of the inverter where the signal is sent to the CTS pin of the communications port of the PC.

   I found that mine would only decode packets when I had the scope connected to the CTS pin or several other pins of the RS232 connector. Puzzling as this is, I finally cured the problem (with a suggestion from another BAYCOM user) by shorting out the 2.2K ohm resistor between the inverter output (pin 6) and the CTS pin of the RS232 connector. I tried a 1K but found that the full current ouput of the inverter was required to drive my comm port.

5. I found that there was an unused pin on the mic connector of my ICOM 245 FM/SSB 2 meter rig, so I connected a wire from the speaker output to this pin, and in turn connected that to the receive input of the BAYCOM board. This allows me to connect to the packet card with only one connector. In order to quiet the speaker, I insert a headphone jack with approximately 8 ohm resistor for a load.

   Incidentally, the volume control on your radio need only be set at about 1/4 turn. It takes very little audio to run the circuit.

6. Once I did get on the air with the BAYCOM packet, I found that I could connect with all the other stations in my area, with the exception of one, and that was a local BBS that would allow me to check in periodically, rather than requiring that I be on the air 24 ours a day. I would try to connect, and would see his packets come across the lower window, but I would never have the messages appear in the recieve window. After about a week of asking around, locally and on Internet mail, I found that BAYCOM doesn't support Version 1 of AX.25 (communications protocol used for most packet traffic) but only Version 2, the latest. The BBS was using the MSYS software and we found that he didn't have the Version 2 status bit enabled. After this was changed, everything fell into place.

Hopefully with the information in the BAYCOM circuit trouble shooting section and these few hints, it should make it easer to start up your circuit. Once you do get it working, you can connect to your own station via another packet station and play with it. Try the REMOTE commands, as well as the others, just to learn how to use it. It really does have a lot of features.

A few days ago, someone was asking about the availability of my software in the USA. By coincidence, someone in Canada has uploaded it to a few landline BBSs in the USA. The BBSs in question are Cleveland Hamnet, COYNET (New York) and WA6RDH (California). I'm afraid that I don't know the telephone numbers, but if you send a packet message to Doug, VE4KV @ VE4KV.#WPG.MB.CAN.NA, he will probably let you know. I will try to get the software uploaded to SIMTEL fairly soon.

    I suggest that you get NCSA Telnet from NCSA at the University of
    Illinois. It's free public software which they support. If you
    don't have a wired connection to Internet, there are some places
    that can connect you but I can't remember where. There are some
    operational problems. K9ALD

Your message is being returned to you unprocessed because it seems to have been already sent to the I-PACRAD list. That is, a message with identical body (but possibly different headers) has been posted to the list recently, either by you or by someone else. If you have a good reason to resend this message to the list (for instance because half of the outbound spool files were lost in a disk crash at some intermediate node), please alter the message text in some way before resending it. Note that altering the "Subject:" line or adding blank lines at the top or bottom of the message is not sufficient; you should instead add a line at the top explaining why you are re-sending the message, for the benefit of the list membership.

Subject: G1NNA software in the USA
To: packet-radio@ucsd.edu

A few days ago, someone was asking about the availability of my software in the USA. By coincidence, someone in Canada has uploaded it to a few landline BBSs in the USA. The BBSs in question are Cleveland Hamnet, COYNET (New York) and WA6RDH (California). I'm afraid that I don't know the telephone numbers, but if you send a packet message to Doug, VE4KV @ VE4KV.#WPG.MB.CAN.NA, he will probably let you know. I will try to get the

software uploaded to SIMTEL fairly soon.

From: rosevax!bert!mikef@uunet.uu.net
Subject: Hints For BAYCOM
To: packet-radio@ucsd.edu

I recently got my homebrew Baycom circuit running and thought that I would share a few of the trials that I experienced in hopes that it will make it a bit easier for others to start up and get on packet.

1. In the troubleshooting section, they refer to the "flashing square". You must realize that the flashing square that they refer to is after you start up "L2.EXE". You should see the flashing square in the upper right corner of your screen, with the DOS prompt still on the screen. The "L2.EXE" is a TSR (Terminate and Stay Resident) program that operates as the TNC (Terminal Node Controller). The other program "SCC.EXE" is the terminal program that displays the packet information to you. When you start the program by using the batch script "BAYCOM.BAT" this first starts up the "L2.EXE" then starts the "SCC.EXE" program.

   You can leave the "L2.EXE" program running and decoding packets, while you continue to use your PC for other purposes, such as word processors, spread sheets, etc., as long as there is sufficent RAM for them.

2. This leads me to another caution. When you do get the BAYCOM running and use the PC for other programs while the L2.EXE is running, if the BAYCOM is running on Port 1, you should avoid using Port 3 if you have it on your system (for a Mouse, communications modem, etc.). The same goes for running BAYCOM on Port 2 while using Port 4 for other purposes. As I understand it, the system shares interupts between Port 1 and 3, as well as 2 and 4. This contention could cause your PC to crash periodically. Another solution is to remove L2 from RAM using the "OFF.COM" program.

3. I also ran into problems with the voltage regulation thru the 78L05 voltage regulator. I only had about 6.5 volts at the input to the regulator, thru the diodes from comm port 1 of my PC. I later found that port 1 gave me sufficent voltage. I haven't verified it yet, but I beleive that that port may be somewhat faulty. If I provide an external voltage, port 1 works, and all diagnostics that I have tried indicate that it is working OK, but it just doesn't provide enough voltage to run the BAYCOM circuit.

   I even tried using a resistor and 5.1 volt zener to supply the regulated voltage, but after finding that port 2 worked, I put the 78L05 back in.

You may be surprised to see -.6 volts on the circuit before the L2.EXE program is started up (which initializes the port), but this doesn't appear to hurt the circuit any.

If you can't find an LM78L05 voltage regulator (I had difficulty) you can also use an LM2936 which also has a low quesent current.

4. If you get the circuit connected, with 5.0 volts to the circuit, but still don't decode the packets, you can open the squelch on the radio. The upper line of the Terminal Program (SCC.EXE) should indicate that it is receiving by the "RECV" on the far left end, just under the Transmit window (upper window). If you don't see this RECV indication, then you don't have any signal thru the modem chip. Trouble shooting from this point will require something to indicate if you have a signal thru the modem chip. An oscilloscope (even an old 5 mhz) is ideal, but you may be able to get by with a frequency counter, or a DVM on the AC range. Again, open squelch and verify something of an AC signal at Pin 8 of the TCM 3105 chip. This is the recieve output form the Modem chip. If this is present, follow it to pin 5, then pin 6 of the inverter where the signal is sent to the CTS pin of the communications port of the PC.

   I found that mine would only decode packets when I had the scope connected to the CTS pin or several other pins of the RS232 connector. Puzzling as this is, I finally cured the problem (with a suggestion from another BAYCOM user) by shorting out the 2.2K ohm resistor between the inverter output (pin 6) and the CTS pin of the RS232 connector. I tried a 1K but found that the full current ouput of the inverter was required to drive my comm port.

5. I found that there was an unused pin on the mic connector of my ICOM 245 FM/SSB 2 meter rig, so I connected a wire from the speaker output to this pin, and in turn connected that to the receive input of the BAYCOM board. This allows me to connect to the packet card with only one connector. In order to quiet the speaker, I insert a headphone jack with approximately 8 ohm resistor for a load.

   Incidentally, the volume control on your radio need only be set at about 1/4 turn. It takes very little audio to run the circuit.

6. Once I did get on the air with the BAYCOM packet, I found that I could connect with all the other stations in my area, with the exception of one, and that was a local BBS that would allow me to check in periodically, rather than requiring that I be on the air 24 ours a day. I would try to connect, and would see his packets come across the lower window, but I would never have the messages appear in the recieve window. After about a week of asking around, locally and on Internet mail, I found that BAYCOM doesn't support Version 1 of AX.25 (communications protocol used for most packet traffic) but only Version 2, the latest. The BBS was using the MSYS software and we found that he didn't have the Version 2 status bit enabled. After this was changed, everything fell into place.

Hopefully with the information in the BAYCOM circuit trouble shooting

section and these few hints, it should make it easer to start up your
circuit. Once you do get it working, you can connect to your own station
via another packet station and play with it. Try the REMOTE commands,
as well as the others, just to learn how to use it. It really does have
a lot of features.

NCSA Telnet will NOT communicate via a TNC, nor will it allow standard
AX.25 packet sessions.

Use Net/Mac instead, available by anonymous FTP from ucsd.edu among other
places. Won't get you to the Internet, but it's a nice place to start on
amateur radio TCP/IP.

I made some changes to my directory structure and now have a problem with
G1EMM (and others) delivering mail to me. It just keeps adding headers
to the mail and leaves it queued up. This seems to be repeated on each
kick. My tnc's are NETROM so I am using nrs attach commands.

If you know of something obvious let me know. It was working fine and then

I started futzing around with how things were set up and can't seem to
back up to where things work again.

Thanks in advance for the help.

Ok, Here's my question.

I want to connect my computer to the internet. What do I have to
do to hook my computer up via packet radio?

I've got a NeXT, so the O/S supports all the internet stuff.
I've got spare serial ports.

???

Every year TAPR hold an annual meeting in Tucson, Arizona. This is supposed to be held so the TAPR board can meet and pontificate on matters of great import.

Just to keep the peasants enthralled, they also lay on entertainment and education. A brief run down of what is in store follows:

Friday afternoon: Hospitality suite, with free M&Ms, tortilla chips (This is the West), nuts, soda and displays of TAPR hardware and software - yes bargain hunters, they often have closeouts and show specials.

Friday Evening: Pizza Bash. Car pool with people you have never met to a red-neck pizza parlor in a shopping mall. Sit near cops eat cheap greasy pizza and swill nasty beer. Courtesy of TAPR, who are just glad you came. Burping and wiping grease off your chin return to the hotel to argue religion or operating systems (same thing) in the hospitality suite.

Saturday day: All day presentations some from manufacturers, some from rugged, wild eyed, individuals. Not to be missed, free coffee. Buffet luncheon, free for registered attendees.

Saturday Evening: Buffet dinner - not lunch left overs hopefully. Repair to hostility suite or Jacuzzi to continue support and suffer denigration of your precious beliefs.

Sunday Morning: More chats and presentations. Later in the day, field trips to Titan missile sites, sleezy bars etc.

Doesn't this sound like more fun than staying home and doing your taxes? Want to join the fun? Here are enough details to get you started. Warning, crass mention of money follows:

Hotel: "The Inn at the Airport" $55.00 per night - special TAPR

rate. Call (800) 772-3847 or (602) 746-0271 for reservations. Note hotel is walking distance from Tucson Airport, or you can call and they will send a van to get you.

Meeting registration $15.00. You can pay on arrival. Cheques usually OK.

Buffet dinner - No one could call it a banquet - $15.00 No Roy Neal will not be the speaker.

Airlines: Make your own arrangements.

You can contact Heather at TAPR (602) 749-9479
(Hours 1000 - 1500 Tues - Fri)

If you are coming, I suggest you call TAPR and at least let them know, so they can arrange for Pizza etc.

Disclaimer. If they knew I was doing this they may have asked me not to.

Check your rewrite file, that's always been the culprit on my
system(s). Bear in mind, that due to some wonderfully "baroque"
code you can only have a single white space character between the first
two fields (unless someone's fixed it). If you have several spaces
or more than one tab - I think it gets confused.

Hope this helps,

If anyone is intrested, I discovered a pretty easy (working!) way to
tune the RX bias w/out recieving packets (it was late, i was tired,
it was going to work before I went to sleep) and w/ out a scope.

I have not seen it documeted anywhere.

Just take a DVM set it to ACV Switch the jumper to do the loopback test,
put the voltmeter on the RXD pin (7? Where the scope should go), run the
600khz tone, and adjust the pot for the largest reading.

It works!
Steve

> What I need to know is: what do I need to

>try TCP/IP on a Macintosh? I've got a Mac SE with 4 megs RAM, PK88,
>and a Knwd TM231A. What else do I need?

1. NET/Mac software, the Macintosh implementation of the KA9Q TCP/IP package.
As someone else noted, it's available from ucsd.edu. It's in the
hamradio/packet/ka9q/net directory. (Hope I got all that right!)

By the way, I use an oldish version of NET/Mac and run it, the mailer
program (BM/Mac), *and* a text editor all in only 1 MB (using MultiFinder).

2. An IP address. The list of address coordinators is also kept on
ucsd.edu in one of the above directories; you can use it to find your
local contact.

3. I'm assuming that the PK88 has KISS mode. If not, you'll need a
TNC that does.

>Also, can I connect to the local BBS's that don't use TCP/IP?

Absolutely. You can connect to any AX.25 node, such as PBBSs, DX
PacketCluster nodes, etc. You can also connect to NETROM nodes.

>Can I connect to Internet with this, etc, etc.

Some areas offer email exchange between AMPRnet (the amateur-radio domain
of the Internet, which you'll be part of when you get up and running with
NET/Mac) and the rest of the Internet. Don't count on finding real-time
connectivity.

Have fun!
Patty

FOR SALE: MFJ-1278 Multi-mode TNC

Includes latest version ROM, multi grey level modem.
1200 baud modem. (Can be upgraded to 2400 baud)
Does SSTV, FAX, packet, AMTOR, RTTY, CW & Navtex.

FOR SALE: MFJ-1289 MultiCom (MS-DOS software)

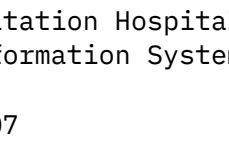
Allows usage of all the 1278's modes w/screen display
for video modes (FAX, SSTV, Color Packet).
(Copy protected version - no CALL encoded)

List: $279.95 (MFJ-1278)
List: $ 59.95 (MFJ-1289)

$339.90

Asking $250 plus S&H.

Can be used for 2 way communications (amateur bands) or for monitoring
those "noises" you shortwave buffs hear on HF.



Full details (on both items) can be found in the MFJ catalog. These
are the current versions being sold by MFJ and as such will require
no upgrades. Since I have 2 1278's (yes two) and no longer use a
MS-DOS machine its time to do some shack cleaning (not to mention I
-WANT- a satellite system real bad ;-).

This message is cross posted to several newsgroups, so if your
interested please reply via e-mail (address below) or voice to
(215) 775-8352.

 have just purchased a SANGEAN 818cs Worldband receiver. I am
interested inb connecting it to my IBM PC in order to decode RTTY
signals and CW.   Can anyone point me in the right direction to where I
can obtain such information. Is it possible with my model of radio.
The receiver does have BFO control as well as an AM gain knob. I
beleive theses features are required to receive these signals.

I would appreciate anyone who can advise me to email their responses to
me.

         vad289s@lindblat.cc.monash.edu.au

Thanks in advance.

I find the documentation that comes from TAPR with the K9NG modem somewhat
sketchy. On the otherhand I may know only very little!
My question(s) are:
1. What traces should be cut on the modem to make it work with a TNC 2 Clone?
2. What traces need be cut in the TNC disconnect header when installing
the K9NG modem.

I ask because I put the modem together, and fired it up. No response at all.
My first thought was "I cut the wrong traces!"

Any help would be appreciated

Also of interest is the fact that the UO-22 satellite has a different
transmit envelope/waveform/frequency-content/whatever that MAY necessitate
use of a wider filter in your receiver. This is certainly the case for
the Yaesu FT-736R. It's stock filter is 12 kHz; I now use a 20 kHz filter
and got much improved results. But things were still not as good as with
uo-14, so I removed C82 (which was shunting some high-freqs just after the
discriminator, and now the 736 has nearly perfect reception. I actually
changed the FM-Narrow filter, so that I retained the 12 kHz filter for
local use.

I have recently acquired an older TNC (Heathkit HD-4040) and have been able to make the necessary cable connections to the IC-32, now what I need if the program that will make this operation work. I am new to the field of packet, and I would appreciate any help.
I have been using procomm plus as a terminal program to 'listen' to the stations, but I would like to get this running as it should.
Any help is more than I have now.
thanks
steve

As far as I know there isn't a poor mans packet for the mac, however I
am in the process of writeing the missing piece. The Net/MAC software
is the ka9q package ported to the mac to talk to a kiss mode tnc. The
mac does have an 8530 SCC chip so it seems kind of silly to have an
entire TNC when you only really need a modem.

I bought and built an A&A Engenering Baycom modem and wired it up to the
mac. Currently I have a test program that can receive and send valid
packets to/from a normal (pacomm) tnc.   The test program does not use
interupts but polls the scc. In the past I wrote a couple of device
drivers for the mac (promiscious apple talk listner, and a
init/cdev/driver to check your unix mail), so I have a lot of experiance
with mac drivers and interupts.   I am writing a driver/init/cdev
called   'SoftKiss', originaly it was going to emulate a TNC in kiss
mode (hence the name) but I got the NET/Mac sources on friday (thanks
Dexter!) and it would be simpler to add a new interface to NET/Mac to
talk to my packet driver.

I added your name to a list of interested people and if all goes well I
will be asking people to alpha test on feb 24.

Steve, the program I use on my IBM is the best Packet terminal program
I have found. It is called "PktGold" (as seen in QST, et al). It is
produced by InterFlex System at 714/496-6639. I don't have the
address, but if you send me email, I'll dig up the address for you.

Gary,
  I use a Mac Si on packet. I took a Mac modem cable, which is a
  standard item, and added a 9-pin connector to make it talk to
  both MFJ and PacComm TNCs. You should be able to get the
  Mac to 25pin D cable from any Mac dealer. It's the same cable
  that runs between a Mac and a Hayes modem.

I'm trying to decode receptions from Dove and the UoSats.

I've managed to receive Dove (frequently and strongly) and Uosat 2 (not so frequently and strongly), and have been recording them on tape.

Unfortuneatly, I don't seem to be having any luck with the format....

Can anyone tell me, what Dove and Uosat 2/22 transmit, in what format, what tones, wether the tones are inverted from normal modem tones, wether it's ascii or not. I have a 1200 baud old basic modem that I've canabilised, and an Intelligent modem that's capable of 300/300 1200/1200 2400/2400 with BLTZ/LAPM/MNP5 (Bell or CCITT).

I've been told that UoSat 2 downloads CCD pictures, is this correct?, can anyone tell me the format?

Does anyone know the schedules for Uosat/Dove for the different transmissions.

Thanks

We've been running the W0RLI CBBS on an XT machine for quite a while
now. Not fast, not fancy, but it (pretty much) works.

We just acquired a 386SX motherboard and have decided to spiff up the
the BBS with it.

We want to allow as many simultaneous users as is feasible, with multiple

users coming in on a single physical TNC. Ultimately, we want the BBS to have just one radio port, a high-speed link to the local NetRom stack. All activity, including forwarding, would take place over that link.

I'm somewhat familiar with G8BPQ as a NetRom emulator, but have never used it with a PBBS. Could someone describe how we would configure W0RLI/Desqview/G8BPQ to accomplish this? And (without starting religious wars), is there a better PBBS software choice for this purpose than 'RLI? (Please note: "better" includes at least as stable and reliable).

TDMA Slot Allocation Strategies for
Mobile Packet Radio Networks

PhD Defense

David S. Stevens
College of Computing
stevens@airmics.gatech.edu

9:30 Thursday, February 27th
Pettit MicroElectronics Center, Conference Room 102B

Abstract

Packet radio networks offer two unique features that cable connected store-and-forward networks lack - a broadcast medium and a dynamic topology. The broadcast medium permits any network node within the range of the transmitting node to receive its packets. The use of a shared radio channel instead of wires allows nodes to move about freely. Yet these same features are a source of major challenges to efficient protocol design.

In this thesis we study the use of Time Division Multiple Access (TDMA) protocols in packet radio networks. We investigate the two general strategies for allocating transmission slots to nodes. We refer to them as "link" and "node" allocation. We also consider the difficulties and issues associated with implementing a higher level broadcasting protocol using these two strategies. Our results indicate that node allocation should be used in radio networks employing TDMA to achieve better delay performance for both single destination and broadcast packets.

In networks with mobile nodes the goal of maximizing the use of the bandwidth seems to conflict with the goal of allowing mobile nodes to locally reallocate themselves TDMA slots. We present a methodology by which both goals can be achieved. Our procedures are distinguished by the fact that we assume that the channel over which control packets are exchanged is shared and unreliable. Our simulation results demonstrate that the protocol will operate correctly under adverse conditions.

Random access protocols deliver better performance than TDMA during periods of light traffic. We consider the concept of group testing to improve the performance of TDMA when these conditions exist. We develop several approaches to conducting group testing in radio networks. The variable-frame length test protocol follows the traditional approach to group testing and limits the number of tests (slots) required to achieve successful transmissions. The hybrid protocol combines the variable-length group testing protocol with TDMA. We also propose a distributed fixed-length protocol. >From the insight gained from this protocol we present a TDMA interleaved slot testing protocol. Our simulation results show this protocol gives the best overall performance.

Hi,
   I am interested in starting up on packet radio and I was wondering if some kind sole would give me some info on how I get started. Particularly, what equipment can I get to add on to my PC in order to link up to a BBS. Also, where are the suppliers of such equipment? Is packet radio used for anything else (other than connecting to a BBS)?

  As you can gather, I know little on this subject so would appreciate ANY info on Packet that you can give.

  In order not to bore everyone, please email me replies at the address below.

Thanks in advance

Subject: Many TNC's <> One radio
Message-ID: <1992Feb19.103328.27570@ips.oz.au>
Organization: IPS Radio and Space Services. Sydney, Australia.
Date: Wed, 19 Feb 1992 10:33:28 GMT

For various reasons I need to run several TNC's off one radio, to
provide multi-protocol/multi-speed support etc on the one channel.
How common is this? If anyone has done it, do they have a circuit
for such a mixer (ASCII or PostScript)?

I envisage something like OR'ing the PTT lines with diodes, mixing
the AFSK audio with a resistive combiner (and possibly an op-amp

to make up for loss), and a similar trick for the speaker audio.

To stop the TNC's from clobbering each other, some of the AFSK audio
can be folded back to the speaker audio, so the others will defer.
Alternatively one could use a "flag generator" from a couple of 555's.
One can also put a "first-in-best-dressed" box on the PTT lines, to
ensure that only one TNC keys up at a time, and possibly gating audio
as well.

Anyone done this, so I won't have to re-invent a wheel?

 It is possible to do what you have mentioned. Matter of fact, there
is a guy in Baton Rouge, La USA who has done it. He has ROSE and a TNC2
hocked up at the same time..

He does not have a UUCP address but can get reached at KD5SL @
KD5SL.#BTR.LA.USA. I am sure he will be glad to help out..

     Since I recently asked about the gateways between internet and
     packet I have gottne quite a bit of mail asking for this info and
     have seen a couple more posts, so I thought I will post what I got:

ps.....tnx Julie!

From cec1!cel.cummins.com!julie@uunet.UU.NET Mon Jan 20 10:43:14 1992
Received: from relay2.UU.NET by en.ecn.purdue.edu (5.65/1.30jrs)

To: n9ljx@en.ecn.purdue.edu
Subject: Packet - Internet info
Status: R

Here you go:

Instructions for the W2XO packet/internet gateway.

To mail from Internet to Packet:
    1. Mail to: "bbs@w2xo.pgh.pa.us"
    2. Make the first line of the text a packet bbs "send" command, ie;
     SP TOCALL @ BBSCALL < FROMCALL
    3. The "subject" line of the internet mail becomes the "title"

line of the packet mail.

To mail from Packet to Internet:
1. I must have the ham call in my gateway alias list. If you want to mail to a specific ham via the internet, send me mail with his/her call and internet address.
2. Once (1) above is accomplished, all that is necessary is to send packet mail to CALL @ W2XO.#WPA.PA.USA.NOAM . The mail will automatically be forwarded to the internet address of the ham whose call this is.

Hope this helps!

This is a list I recently downloaded from WB9UUS.

=-=-=-

Gateway to: 44.80.32/24 (reliably) Central Pennsylvania
Gateway to: 44.112/16 (not so reliably) Western Pennsylvania
Internet address: af2j.ece.psu.edu 128.118.5.172
Packet address: gw.af2j.ampr.org 44.80.32.136
AX25 mycall: af2j
Run by: Joe Reinhardt af2j
Internet email address: jmr@ecl.psu.edu
Services: no anonymous logins or ftp. SMTP.
Axip: No
Other useful IP addresses: kb3kj 44.80.32.128 (Jim, Port Matilda, PA, IBM PS/2)
af2j 44.80.32.135 (Joe, State College, PA, Mac)
ka3wut 44.80.32.139 (Ryan, Dubois, PA, Amiga)
????? 44.80.32.140 (???)

Gateway to: 44.76/16 South Texas
Internet address: hamgate.cs.tamu.edu 128.194.2.126
Packet address: hamgate.wb5bbw.ampr.org 44.76.0.5
AX25 mycall: WB5BBW-9
Run by: Kurt Freiberger, WB5BBW (409)847-8607
Internet email address: kurt@cs.tamu.edu
Services: ftp telnet finger echo
Axip: No
Other useful IP addresses:
Notes: One RF port, 1200 bps, 145.09 Mhz. Local BBS: W5AC.#STX.USA.NOAM
24 hour operation. May be down between 8-5PM CST/CDT for other
activity.

Gateway to: 44.72.0/18 Chicago Area, Illinois, USA
Internet address: ke9yq.imsa.edu 143.195.1.8
Packet address: ke9yq.ampr.org 44.72.38.50
AX25 mycall: ke9yq
Run by: Bob Van Valzah ke9yq
Internet email address: bob@imsa.edu
Servers: ftp telnet smtp finger
Axip: No for now, will entertain proposals
Notes: Wa9aek [44.72.40.129] (Ken Stritzel) is the local FTP and mbox
server. He's also my gateway to most of the rest of 44.72.0/18.
N4pcr-1 [44.72.38.34] (Don Lemley, Gracillus Communications, Inc.)
is the nearest IP switch. He has 56 Kb links to other IL sites, but
I don't know how to use them yet. I don't know enough about NOS
administration yet to've set up much of an environment on the gateway
itself.

Gateway to: 44.48/16 Indiana, USA
Internet address: k9iu.ucs.indiana.edu 129.79.16.175
Packet address: k9iu.ampr.org 44.48.0.22
AX25 mycall: k9iu-5
Run by: Dwight Hazen wb9tlh
Internet mail addres: hazen@hazen.ucs.indiana.edu
Servers: telnet ftp smtp finger netrom

```
axip: no
Other useful ip addresses: 44.48.0.2

# This doesn't exist yet. Soon.
#
#Gateway to: 44.136.138/24  Brisbane, Australia (vk4)
#Internet address: vk4kiv.star.qut.edu.au      131.181.5.122
#Packet address: vk4kiv.qut.ampr.org           44.136.138.34
#AX25 mycall: vk4kiv
#Run by: Andy Joyce vk4kiv
#Internet email address: joyce@qut.edu.au
#Servers: ftp telnet smtp finger
#Axip: Yes
#Other useful IP addresses:
#Notes:        The host will forward bulletins under AX25 to VK4DGQ from Usenet
to
#      QLDNET or SEQLAN.

Gateway to: 44.32/24    SouthEastern Colorado, USA  (Colorado Springs, etc)
Internet address: hpcsos.col.hp.com             15.255.240.16
Packet address: gw.n3eua.ampr.org               44.32.0.1
AX25 mycall: n3eua
Run by: Bdale Garbee N3EUA
Internet email address: bdale@gag.com
Services: the gateway runs on an HP 9000/370 using Mike Westerhof's prototype
        IPIP daemon.  The .1 address is a Gracilis PackeTen standalone switch
        in my basement.  Right now, the PackeTen is the only thing reachable.
        I've set up routing info for all hosts in the gateways file...
Axip: "or not!"
Other useful IP addresses: none yet

Gateway to: 44.72/16 Illinois, USA (most of central and southern IL)
Internet address: pc1798.bradley.edu  136.176.110.10
Packet address: wb9uus.ampr.org        44.72.123.97
AX25 mycall: wb9uus
Run by: Chuck Henderson  wb9uus
Internet email address: chuck@bradley.bradley.edu
Servers: ftp telnet smtp finger netrom
Axip: soon
Notes:
       The RF part of this system is not operating properly but should be soon.
       I am setting up a connect into the 445mhz Backbone that covers much of
       IL. Nearest MSYS bbs is N9HWO.IL.USA.NOAM    n9hwo.ampr.org 44.72.108.1
       I don't know enough about NOS administration yet to've set up much of
       an environment on the gateway itself.  Any and all help is welcome.
       The Internet address will soon change to wb9uus.bradley.edu 136.176.5.9
       An updated version of this file will be sent to gateways@uhm.ampr.org
       when the date of the change is known.
```

```
Gateway to: 44.136.72.x to 44.136.137.x        Victoria, Australia (vk3)
       44.136.72...79.x        Melbourne
       44.136.81.x             Shepparton
       44.136.82.x             Bendigo
       44.136.83.x             Western Victoria
       44.136.84.x             Ballarat
Internet address: murban.met.unimelb.edu.au    128.250.120.17
Packet address: vk3rum.ampr.org                        44.136.80.4
AX25 mycall: vk3rum (to vk3bbs, vk3bbs-2 (bpq switch) via link)
Run by: Peter Hallgarten VK3AVE on behalf of Melbourne Packet Radio Group Inc.
Internet email address: vk3ave@csource.oz.au
Servers: ftp telnet smtp finger netrom
Axip: Yes
Other useful IP addresses: 44.136.80.2 vk3rpa
Notes:  vk3rum is connected to a 9600 Baud Full duplex link to vk3rpa & vk3bbs
       on callsign vk3rum. To gain access to other ax25/netrom systems connect
       to vk3bbs-2 (G8BPQ Switch) and then use it as a link to the outside
       world. VK3BBS runs G8BPQ network switch supporting W0RLI BBS and NOS
       and is Victoria's (Serves Most of VK3) HF Mail Node.

       Other gateways should add the following routes to catch all of the
       address space above:

               route add 44.136.72/21 encap murban.met.unimelb.edu.au
               route add 44.136.80/20 encap murban.met.unimelb.edu.au
               route add 44.136.96/19 encap murban.met.unimelb.edu.au

---
end

--------------------------------------------------------------------------------

There is also information about these gateways in the faq_packet file available
via anonymous ftp from ftp.cs.buffalo.edu. The FAQ should be posted in the
next couple of weeks, so if you can't ftp just be patient.

     There is NO SUCH Thing as "stupid question".

>
>What is NOS, and is it something that the average packeteer can use?

     NOS stands for Network Operating System. It is rather complex piece of software started by Phil Karn (ka9q) to allow TCP/IP networking on the amatuer packet network. (I'm sure others will expand on various points on this ;-).

     The 'average' packeteer would probably be overwelmed by MOST of the features in NOS. However, if your interested in doing something with your packet station besides keyboard-to-keyboard or BBS'ing then you might want to give it a try.

     BEWARE! It's NOT for the faint hearted. But it can sure be FUN!!

>
>At least two hams are using PLL rigs and doing quite well :-) and they
>don't have to buy endless pairs of expensive rocks every time the
>local "evil C-word" group changes their mind. 1200 baud Bell 202 AFSK
>is just not that critical, considering that it's inherently flawed.

  1200 baud is inherently flawed? Huh? How? It works for me. Just cause
it isn't 9600 baud doesn't make it broken, at least not to impartial
observer.

>Not all PLL's are as slow as you seem to indicate. My Icom 290H (PLL
>PIN diode switched multimode) works just fine at TXD 3 (30 mS), which
>is as fast as we've been able to get any rig - rockbounders included.
>In fact, _some_ crystal controlled rigs are absolutely pathetic
>regarding TR turnaround time.

   Sure, even my lousy TR-22 was slow to return to receive from transmit
until I buggered the power supply to leave the receiver running while
transmitting. However, as a *general* rule, which is what I presented,
PLL rigs tend to be quite slow to turnaround in either direction.

  However, I've noticed many multi-mode radios turn around very quickly.
Maybe this is because they want to be able to offer reasonable CW
performance, for semi or full break-in keying.. who knows? The average
radio on 2m, that is a PLL FM-only rig, tends to be slow.

>The absolute here is that there ain't no absolutes.

    Nothing like clarifying an issue with a sage observation.

>It's not good to run txdelay at the minimum, though - the rigs need

>time to stabilize (on both ends), and the BER suffers if you cut it
>too close. A bit error is every bit as bad as a collision.

    Strictly speaking, I don't think I'd classify a frame lost
due to insufficient TXD as a 'BER' problem; sure, you can use the
term, but it is misleading. 'Bit Error Rate' implies the maximum
performance of the link under steady conditions, at least to me.
However, you are correct that insufficient TXD results in lost
frames. But, a frame lost due to short TXD is not as bad as a collision;
since the frame was being transmitted, the channel stayed busy, and only
one station has to retry. With a collision, it is possible for two (or more)
stations to retry...

>We've found that TXD 10 at 9600 baud, and txd 30 to 40 at 1200, seems
>to work best with most stations, and the extra TXD does not contribute
>to collisions. Remember - even though you're not broadcasting "data",
>you're broadcasting a signal that will activate DCD, or in the case of
>1200 baud non-MFJ modems, will activate the noise detector electro-
>junk they laughably call "DCD".

  Electrojunk? Excuse me. My PK-88 has a TAPR State Machine in it... is
that junk? Hmmm? Anyway, you've completely missed the point about
TXD; I'm not talking about emitting a lone, useless idle sequence;
I'm talking about a radio which goes deaf and does not start transmitting
for 100-200 mS; this window allows collisions.

>You're right about relays - unless you mute them with marshmallows,
>they won't make more than txd 1 worth of difference - and I'm
>grudgingly conceding that! Just because they're mechanical doesn't
>make them ridiculous. I still use relays in some of my designs.
>They're much more forgiving of indiscretions. However, XYL's have
>expressed a definite preference for PIN diodes over relays at 3 AM
>when the local insomniac is banging away at your station.

    Most relays I've seen are worth 20 mS (or TXD 2) of delay.
Why is your XYL sleeping in the shack? Mine sleeps in bed with me
in the bedroom...

Could someone post the U5MIR-1 frequency data for packet? I heard U4MIR on 145.55
voice yesterday, just by chance.

Dave, the frequency for packet is also 145.550. Aparently, they are mostly
on packet, but ocassionaly can be heard on voice..

By the way, a good satellite tracker such as TRAKSAT really helps. I loaded
up the most recent 2-line element sets from NORAD and was able to hear
MIR within a minute or so of the predicted time of signal acquisition..

Also, has anyone heard anything about how long U5MIR will be on the air.
Someone mentioned that there may not be any hams on board in a few months.
Anyone know about this?

Does anyone have experience attaching a G3RUH to a DR-1200? What about
for a Icom IC-228/229 ? We are in the midst of setting up a 9600 LAN
here, and I'm kinda wondering how easy/hard it is to get these modems
interfaced to the different radios...

Thanks
Derek

Take a look at 4800 baud as well. It's not that hard and worth
the effort.

> Note for Australian readers: what would be a good channel to use, to establish
> a "de-facto" standard in the event the modes are incompatible? Most of the

Hmmm. It changes in each place. Most of the whole 2m band is
deathly quiet here in the ACT :-(however it's quite busy in
Sydney. You'd have to use one of the "packet allocation"
frequencies at 144 Mhz, something like 144.750 or something.

> Note for non-Australian readers: I realise that Australia is quite backward

> in packet operation, due to ossified thinking, but some of us are trying to

> for 56k bps operation etc, don't even ask...

<sigh> 1200 baud UHF links using ROSE is the joke. :-(We have
a small 4800 baud NET/ROM network operational as well, Dave.
Hopefully Sydney/Melbourne Connectivity sometime in the next few
months. (It'll be slow though, most of it will be at 1200 baud.)

>   ADA - from the people who brought you COBOL

<groan> One of the local Uni's is rewriting an introduction to
computing coure. Guess what the teaching language will be.
(Yep, ADA, guess they want to throttle the number of computing
students)

An Amateur Radio <-> Internet gateway is very unlikely, for several reasons:

1. You cannot transmit "obscenities" over the air, making most

netnews non-transferrable.

2. You can't transmit crypted/cyphered messages, making a "batch" newsfeed, FTP transfer, etc., a "no-no" on the AR bands.

3. A control operator must inspect each message before it is sent (for reason #1) thus making inbound e-mail sorta hard to get, unless the control operator of the sending site reads all your e-mail.

A new test version of AA4RE BBS called BB2.1V is now available. New features include better monitoring of BPQ node and an integrated callbook lookup routine.

The following files will be available from tomcat.gsfc.nasa.gov and ucsd.edu via FTP:

   BB21V.ZIP -- All files
   BB21VU.ZIP -- Files updated since 2.11
   SAMDEMO.ZIP -- Demo of callbook database

Drop me a note if you have any questions.

Does anyone know where I can get an updated copy of PACKCOM. I'm running version .75 and I'm impressed by some of the features. However, I've found a few bugs that would be good to have fixed from a later version.

Thanks

The title says it all. I am a happy owner of the Kansas City Tracker card, but I would be a LOT HAPPIER IF I could upgrade it to include the tuner functions. The card has got empty IC places for the needed circuitry for tuner use, but no schematic. Has anybody got the complete tracker/tuner version? If so, could you kindly tell what chip/component is needed for the tuner and where they are located.

I want to connect my PK-232 to my Alinco DJ-160 (2m-only handheld) for use on packet. The PK-232 manual gives connection instructions for many radios (incl. the new Radio Shack handheld!) but not the DJ-160. The DJ-160's manual gives no clues as to the pin-outs of the spkr and mic jacks; it recommends using an Alinco spkr-mic "for best results." I don't have a service manual. I think I've figured out how to do it, but I'd rather not fry either of my toys, so I seek advice.

The mic jack is a 3-pin stereo. Testing with a DVM on my (Alinco--I'm a big fan of "best results" (:-)) spkr-mic, I've found which of the conductors is ground, PTT and mic. When PTT on the spkr-mic is pressed, resistance gnd-PTT goes to about 1K (but not zero). Perhaps this is the resistance of the little "xmit" LED in the spkr-mic? Curiously, when I plug a three-conductor plug into the jack on the radio, I see 5 VDC across gnd-PTT *and* gnd-mic. Shorting gnd-PTT through a 1K resistor makes the unit xmit; shorting gnd-mic does not. I think this means that I need a 1K resistor in the PTT line between

TNC and radio, and a 0.1uF cap in the mic line to block the DC. Is
this right?

If you have direct experience or advice, please e-mail to me. I'll
summarize to anyone who's interested. Thanks in advance!

This is a common question that is in the FAQ. The standard answer is
to check Simtel20, WUArchive, or look for the program's name in the
Archie FTP database index.

Here is information about Archie, taken from the alt.bbs.internet
services list:

[...]
 -Archie   telnet archie.mcgill.ca or 132.206.2.3 (Can./USA)
              telnet archie.funet.fi or 128.214.6.100 (Finland/Europe)
              telnet archie.au or 128.184.1.4 (Aussie/NZ)
                 telnet cs.huji.ac.il or 132.65.6.5 (Israel)
                 telnet archie.doc.ic.ac.uk or 146.169.3.7 (UK/Europe)
                 telnet archie.sura.net or 128.167.254.179
              telnet archie.unl.edu (Login: archie, pasword: archie1)
                 telnet archie.ans.net or 147.225.1.2 (North America)
   offers: Internet anonymous FTP database. (Login: archie)

 I was wondering if this AmigaNOS would be of any use over a null-modem connection? Basically I'm looking to connect two 500's to a 2500 via null-modem so that they can access files/programs. (Yer basic network task). I've attempted DNet with no success (It can only do a hookup anyways) so would AmigaNOS be a possible answer?

   An Amateur Radio <-> Internet gateway is very unlikely, for several reasons:

        2. You can't transmit crypted/cyphered messages, making a "batch"
           newsfeed, FTP transfer, etc., a "no-no" on the AR bands.

I do FTPs over the air all the time. I think you are thinking that compressed data is not legal. I think that compressed data is just binary data and should be legal, unless it really is encrypted as is possible with many archive programs.

        3. A control operator must inspect each message before it is sent
           (for reason #1) thus making inbound e-mail sorta hard to get,
           unless the control operator of the sending site reads all your
           e-mail.

this is not really a legal must as it is a practical must. you can

allow unattended station operation but when 3rd party non amateur
stuff is going out on the air it is the gateway owner's call that is
on it and who is responsible.   it is to his/her advantage to inspect
stuff before it goes out.

This is interesting discussion, but are the rules any different in Canada?
Note that is where the original poster is from. This brings up an awfully
interesting point - we know of the potential difficulties with internet - ham
gateways here in the US. Could they be circumvented by using a gateway in
another country??? (Did _I_ ask that ;-) Of course, then we might have to
worry about third party agreements and such.

About five years ago I spent a couple of days running around looking
for electronic surplus places. I had made up a list but I don't know
where it is right now. Some places I remember are:

Artesia Metals -- they're on Artesia Blvd. east of Hawthorne. They
have a warehouse full of parts; I don't remember any test equipment,
though.

Orvac Electronics -- they're on Orangethorpe Ave. out near Anaheim.

R & D Electronics -- also on Orangethorpe Ave. in Fullerton.

Here's a suggestion: if you can, pick up a copy of Nuts and Volts
magazine. Look for any advertisement with a 213 or 818 area code or
an L.A. address. That will give you a good starting point. When you
get there, check the Yellow Pages in each area you visit. Look under
the classifications "Electronic Parts -- Retail", "Electronic Parts --
Whol & Mfrs", "Scrap Metal" and "Surplus and Salvage Merchandise".
I built up a fairly complete list for the SF Bay area that way.

I'd be interested to get a copy of whatever list you come up with since

I may be out there again someday.

     Good luck,
     ---Bob.

     obcenities are questionable and are set by local community
     standards. Most groups could pass with little to no problems.
     granted alt.sex would most likley be a problem, but many
     tech groups shouldnt be.

>   2. You can't transmit crypted/cyphered messages, making a "batch"

     Wrong here... crypted messages are illegal if the reason for
     encrypted message is to hide the message from other. Batched
     newsgroups are compressed and not crypted. The reason for the
     compression is to intrease the throughput not hid the contents.

Greatings, I am interested in APlink.

I will bestarting from scratch.

Is there any paticular fearures in a HF rig that I will want when buying for
this purpose?

I can gess that having computer control capability and non relay PIN diode
T/R switching is a plus, But what about others features?

Also, what kind of packet setup would be best to go with APlink? Just
any gereral packet setup or somthing more specific?

I am very tech. knowledgeable so give me both barrels(of information).

thanks and God Bless in Jesus Name.
denny.

AEA has an upgrade kit to convert a Model PK-232 to a PK-232MBX. It includes a firmware upgrade, a memory upgrade, and a new battery. It was pretty easy to install. I got mine a few years ago, and I think it cost about 69 bux.

I am just getting started in satelite packet, and have been TRYING to work MIR whenever I hear them. I would prefer to KNOW when they are coming, and I assume that a satelite tracking program is what I need. I saw one such program, but was not thrilled with it's user interface. It produced CURRENT satelite position data.

I would prefer a program that would tell me when MIR is 'visible' to my location, for the next day/week/whatever. Anything out there that has such output and can be used by an idiot like myself??

I'll summarize to the net, so e-mail and save some bandwidth.

Recent court cases, most notably the infamous "Sh*t Happens" case
in Georgia (USA), may have bearing on amateur radio usenet gateways.
The courts have said something to the effect of (no, I'm not a lawyer
and don't understand all of the Constitutional Law implications)
the state cannot pass laws restricting the use of printed words,
even though the printed words are publically and intentionally
visible. In the "Sh*t Happens" case a law was adopted that made
printed obscenities illegal. The courts ruled the law unconstitutional.
Any ideas on how this impacts packet radio?

Every so often, someone asks about a packet <> internet gateway. (probably should be a FAQ on this). Anyway, would it be useful to create a newsgroup that would take all the articles from the packet BBS network, and post them on the Internet Netnews system? I would see it as a moderated group, the moderator would have a radio and TNC grab the packet BBS articles and post them on this newsgroup. People wishing to post to this group (and on the packet BBS network) would send it to the moderator. The moderator would check it for FCC rule compliance, and allow the good articles to get onto the packet BBS network (with his call attached to it unless he knows your call and he knows that it is legit). He probably wouldn't inspect the stuff from packet. But he would form the gateway for packet to internet, thus avoiding someone else duplicating postings.
No, I don't have the time or equipment to do this myself, so I can't volunteer. (I have posted an occasional packet BBS article, but I don't have enough resources to attempt the above.)
Why do this? Well, it would give hams with access to the internet, but who don't have packet stations, access to the stuff on packet BBSs.
Also, unlicensed people could also get to read these articles.

How does one observing a transmission know whether the binary data is in

fact just plain binary data or is "encrypted"? The only way I know is to examine the table of contents (as in the case of pkzip) to see if any files internal to the zipfile are, in fact, encrypted. This is next to impossible via FTP.

Personally, I would love to establish an Internet gateway via KA9Q so local hams could access the Internet for FTP, etc. However, I'm unsure that under current FCC regulations it is possible to do so without getting a little 'Notice of Violation' in the mail.

MD

I Use AmigaNOS on my 2000 to send/receive files to/from my 386/40 PC running NOS.EXE at 19200baud at about 5k/sec using SLIP.

Cheers, John.

A "batch" feed is just a file transfer using a well known, published algorythim to *facilitate communications*, perfectly legal. KA9Q's TCP/IP implementation for amateur radio does FTP just fine thank you, and it's perfectly legal. You still can't transmit obscenities, even compressed (maybe). This walks into the area of defining obscenity. Transmitting a compressed obscenity is like transmitting Midi sequences. Is it music, and thus forbidden, or is it control codes and permitted? In other words, is an obscene word transmitted as a compressed file obscene? The Supremes say that they can't define obscenity, but they know it when they hear it. Will they know it by listening to a compressed transmission?

That's kind of like saying that if I don't know French and two amatuers are
talking it French, that to me it is "encrypted."

How about alt.bbs.packet? It would fit nicely under the alt.bbs.*
heirarchy, and since it was an alt group, you wouldn't need the formal
call for votes such as in a rec.* newsgroup heirarchy.

I don't really have a problem with it, but it depends on someone with
lots of time to come in and do it. Any volunteers? (I already manage
the Elmers list, and would be happy to add to the list such a volunteer)

Check out news.lists, news.groups, news.announce.newusers, and alt.config
for more information.

Actually, there exists a general FAQ for the newsgroup with a pointer
to a gateway discussion mailing list. There is also a list of all
current gateways.

Both should be available via anonymous FTP from ftp.cs.buffalo.edu or via
mail server from ftpmail@decwrl.dec.com.

I have been reading several of the topics for the past week or so, but I
have had no time to post comments to them this week. So, now that I have
the chance, I think I will take it.

     Several folks have commented on problems adapting older crystal
controlled 2 meter rigs designed to operate in the 146-148 range to packet
operation. When I was looking for a rig to use on packet, an old ICOM rig
designed to operate in this range caught my eye. While looking through the
manual, I noticed it listed specifications for the European model. Recall

that in ITU region 1, the 2 meter allocation is only from 144-146, so in order to market their rigs in Europe, manufacturers had to produce a different version. Apparently the only real difference in this model was a particular crystal. I suggest that anyone who is thinking about modifying one of these rigs for packet check to see if there is a European version. If there is, modification should only involve replacing a crystal and realigning the rig.

I also noticed the discussion concerning the logistical problems in setting up Internet<>AMPRnet gateways. One comment was that FTP transfers, newsfeeds, and the like encoded and so not permissible on the Amateur bands. However, the FCC rule on the matter only prohibits "codes and cyphers" intended to OBSCURE the meaning of a communication. Codes intended to facilitate transmissions without obscuring the meaning of transmitted information are permissible. When files are zipped, ARCed, squeezed, etc., the intention is to reduce file size, not to encrypt information. In fact, transmitting files in a compressed format would actually keep traffic down on the channel. Binary data is thus not taboo material per se.

The real problems for setting up a gateway are making sure no business, encrypted, or indecent material gets forwarded onto the amateur bands. I could just see the FCC having a fit over a newsfeed containing GIF's in the newsgroup alt.binaries.pictures.erotica being forwarded into the AMPRnet! But to date, I have not seen anything posted to this digest that might be considered taboo on the AMPR or AX.25 network. However, the fact remains that unless we get some major rule changes from the FCC regarding business communication and a realization by J.J. Freeman that BBS operators should not be held strictly liable for illegal material transmitted by their automated stations, any gateway is going to have to employ some kind of human element to ensure improper material stays off the Amateur networks. I do not believe that the AMPRnet will ever become a fully integrated part of the Internet simply because of the nature of the Amateur Service, but certainly the FCC can slack up a bit to allow for the use of new networking technologies.

Hi again.

First of all, let me apologize if my first posting appeared more than once. I'm quite new to newsgroups, and, to tell the truth, I was under the impression that I was sending to individual (humans) and hence quite possibly cross-posted...a no-no I'm no doubt going to be "flamed" for.

I received quite a few responses to my queries, most of them negative, some of them quite contradictory to others. I'm going to summarize what I've learned here for the benefit of others.

1) There are many FCC (and other) regulations which limit the use of packet radio (and HAM in general).

- I was told I couldn't use radio for "commercial" business, in fact almost everyone who responded thought I wanted to. This was never my intention in the first place (I'm just an individual computer-geek, not an organization of them!).

- Every message (esp. from Internet to packet) must be "hand-filtered" ie censored. Not sure if I like this idea, but it was explained to me that one obscene word could jeopardize the licenses of every rig the message passed through. Kind of a *retarded* regulation, but...!

- You would require a "god-class" licence to read non-amateur sourced material over the air.

2) Packet Radio is notoriously slow (for most technologies).

- TNC's (Terminal Node Controller) only go about 1200 baud (300 for long distances).

- Apparently you can get faster connections, but you've basically got to be "line-of-sight", and there aren't alot of amateurs who have upgraded to faster modems.

3) Somebody from Hawaii suggested I ask everyone about the "Proxim" modems and use the unlicensed/experimental bands. Apparently the throughput is faster as well?

4) I'd appreciate hearing about hooking packet radio into the satellites... this sounds particularly exciting!

Finally, I would just like to point out that all I wanted to accomplish is to get a mailbox on the Internet! Currently I have to call all the way to Ottawa to do this, and I wanted to perhaps use radio for a "anytime" method of access; providing me with mail, news, irc, and ftp.

However, thanks to the generous amount of mail, I understand that radio is alot more complicated than I anticipated! The rules and regulations are quite intimidating to the uninitiated; and are enough (at least in my case)

to scrap any plans on continuing. You scared me off...thanks, guys! :-)

But, as one user quoted:

  "...it isn't the computer part that is fun, it's the radio part...Maybe
  we can turn you into a radio-geek!!!"

I *do* like the idea of talking to somebody half the world away. Oh well, maybe I'll bug my friend to start hammin' again so I can see what I'm possibly missing.

Thanks,

Steve Frampton

Haven't seen such a review, however, I have reviewed all of these units for the RTTY Digital Journal (MFJ still in review). The MFJ would be the easiest to upgrade to 9600 on VHF. Just takes a daughterboard plug in. AEA PK232 doesn't really support 9600 yet, but probably will soon. KAM by Kantronics uses there Data Engine to get 9600. HF reception on all of these units on Packet is similar. I like PK232 on Packet. KAM on CW and RTTY. MFJ on Vhf Packet. All pretty darn nice units. Right now I reall

y like the KAM with the HostMaster II software which allows me to monitor PacketCluster and mess with the other digital modes at the same time.

Internet Gateways

It seems that almost everyone who is talking about an interrnet gateway aren't familiar with EXACTLY these internet gateways are used for. We set up gateways all the time and they work fine and legal.
     The gateways generally aren't used for people to access the internet for file transfers and telnets, but they are used to connec t other amateur systems together. For instance, we would have a gateway in Detroit, Michingan and one in Canberra, Australia. Then an amateur in Australia on 2m can basically digipeat through the gateways an~d appear on 2m in Detroit. That person canot connect (excuse the mistakes) to an internet system nor can anyone on the internet connect (or at least leaave) our gateways or have amateur access. We can also FTP or telnet THROUGH the gateways connected to each other. Y
     If the gateway allows it, you can telnet from it to an internet system, but if you are on the amateur side and are trying to telnet or FTP to and internet system, it shouldn't come back to you since the internet doesn't handle the 44 addresseds used in amateur radio. Only the gateways know to send the 44.xx x addresses to the corresponding gateway that can handle it.
     We are in effect 'digipeating throught the internet' and n   ot connecting or allowing internet connections to happen. It is also suggested to shut off SMTP or at least have them not leave the gateway to prevent non-amateurs from possibly sending messages to the amateur community.

     On the talk of compressin. on, people use pkzip, arc, lz, sit, ertccc... all the time for FTP's. It is a standard mode

of compression and can be used. In fact we run WNOS which does LZW
compression on SMTP's. The intent is NOT to hide our messages or
to encrypt them, but it is to use up less bandwidth and make more
eficient use of our spectrum. Isn't this what amateur radio is
also about? Many people are ticked off that compression is going on,
but it's better use of spectrum. Some of the BBS softwares also
do compression and more will be going to it. This will make the day
of watching the forwarding stop, (monitoring it that is), but there
will be better throughput and your messages will arrive sooner.
     We are trying to make this system better and not trying to hide data.
If a standard mode is used, then it's legal.

     As for things like Usenet mail, I'd personally not handle it or
make it very limited baecause that would have to be screened.

(if there are errors in this, I'm typing it blind)   I miss ELM.

Message-ID: <UUG.92Jan26012541@fs.cpsc.ucalgary.ca>
Date: 26 Jan 92 08:25:41 GMT
Organization: UofC cpsc
Lines: 159

Short description:

  This device driver for the SunOS kernel allows the kernel network
  layer to send IP packet inside AX25 (using a TNC on a serial port),
  exactly like KA9Q NOS does.
  The AX25 device appears exactly (ok, minus possible bugs :-) like
  any other network device does to the kernel, so you can use any old
  regular SunOS TCP/IP programs (ftp, telnet, etc). (Tested on Sun3/60
  and Sun4/260, SunOS4.1.1.)
  VERSION 1.0 deraadt@lego.cuc.ab.ca

Availability:

   Our SunOS AX.25 IP device driver is now available for anonymous ftp
   at ucsd.edu in /hamradio/packet/ka9q/incoming/sunos_ax25ip.shar.
   Source and man pages only, it's 46116 bytes.

I'm also willing to distribute it by email -- just drop me a note at uug@cpsc.ucalgary.ca asking for it.

Long description:

AX25(8) MAINTENANCE COMMANDS AX25(8)

NAME

ax25 - AX25/IP ifconfig Utility

SYNOPSIS

ax25 [-v] <network address> <ham call sign> <tty_name>

DESCRIPTION

Amateur packet radio enthusiasts nowadays send IP packets over radio links. Hanging off a serial port on their computer, TNC modems are used to provide CSMA-like behaviour so that the single radio channel can be shared between multiple stations (somewhat like how ethernet works). Packet radio is a broadcast medium, hence the TNC is responsible for sharing the bandwidth with other TNC's. The computer talking to the TNC must use a protocol called KISS (a simple derivative of SLIP encoding) to send/receive packets to/from the TNC.

AX25 packets vary in length. The packet header at the start of the packet has four parts:

1. A (guaranteed to be) unique source address.

2. A destination addresses.

3. An AX25 packet type field. In our case it is always set to UI, to indicate that this is an AX25 datagram.

4. A small number, choosing between various higher level protocols, called the protocol ID.

The addresses found in the header are a simple 7-byte encoding of the HAM radio call sign and substation ID. These addresses are used just like ethernet hardware addresses

are, to provide a unique name for each station. The protocol ID can choose between many protocols but users of IP-over-AX25 under Unix are really only concerned with two AX25 sub-protocols: ARP and IP.

AX25 packets (received via KISS encoding from the TNC) which are found to contain ARP or IP datagrams are decoded and handed off to the kernel networking code. Similarily, the network code gives outbound datagrams to the AX25 device driver, where the reverse process occurs: they are encapsulated in AX25 packets and, after KISS encoding, sent off to the TNC for transmission.

Both incoming and outgoing ARP datagrams require special handling. The Unix kernel's internal ARP cache contains translations between 4-byte IP addresses and 6-byte ethernet addresses. It's convenient to not rewrite the kernel's ARP implementation, so an encoding scheme was developed which

converts 7-byte AX25 addresses to/from 6-byte ethernet addresses. This is too twisted to describe here, so refer to the device driver source.

OPTIONS

You must be root to run this. It's a good idea to start it from /etc/rc.local in the background.

-v Print out more information while setting up the link.

<network address>
This provides the IP address for the network port. This name gets passed to ifconfig(8), so it can be a name out of the hosts(5) database.

<ham call sign>
This is your HAM call sign, with your substation ID.

<tty_name>
Communicate over the named device at 9600 baud.

EXAMPLE

```
ax25 44.135.145.28 ve6uug-0 /dev/ttyb
```

BUGS

Etherfind doesn't work as expected the first time you run it!

TNC's that toggle DTR for each packet can cause problems because streams M_HANGUP and M_UNHANGUP messages are treated incorrectly. If you see console messages about M_HANGUP and M_UNHANGUP, cutting the DTR line will solve the problem.

I know this request deviates a bit from the intent of this listserv, but
I still hope that someone can help me.

I'd like to run K6STI's   MNJR program on am Amiga 500 computer, which
is not an IBM compatible computer (uses a 68000 cpu).

 Does anyone know if the source code to MNJR by K6STI is available, so
that I could try porting it to the Amiga? (Yes I realize the program
is copyrighted and I am prepared to pay for the source code).

If the source code is available, could someone please send me the phone
number for ordering it?

Thanks,

The rules say that you can use "any code" to facilitate communications
above 420 Mhz. If you aren't using a standard code, you must keep a
copy of the code at your station so the FCC can request it to decode
something they monitored if they want to. Just because Joe Average
Frequency Cop can't turn "monitor on" in his TNC and print plaintext
on his ASR33 is no reason to stop you from using a particular coding
method.

>Any ideas on how this impacts packet radio?

That's not exactly what the court said. Basically, they said that that
particular message was social commentary and thus had "redemming social
value". That's the catchall phrase they use when weaseling approval
of dirty language, pictures, and exibitions. They also said that the
Georgia statute was "impermissably vague", their weasel words meaning
that they didn't know how to interpret it.

As you may know, the FCC quit enforcing their 7 dirty word list some
time ago because Commission lawyers said it could infringe speech
containing "redeeming social value" or speech that met "community
standards". Very recently the Commission has tried to crack down
on "Shock Radio" with no success. Tipper Gore's pressure group was
trying to get it banned, but the Commission's lawyers couldn't find
a sufficiently weasel worded regulation that would stop it and still
pass muster with the courts. They tried a couple of approaches, but
so far they have lost in court.

The FCC has tended to take a market approach to regulation in recent
years. They have taken an extremely relaxed approach to technical
standards. Their contention has been that stations that don't put
out high quality signals won't get good ratings so the problem is
self correcting. In matters of content they tend to follow a similar
line. If it gets good ratings, it must be meeting community standards.

I'm not a lawyer either, but my company keeps some very expensive
ones on staff to track First Amendment cases. They publish internal
memos telling our staff what they think we can and cannot do. Their
current opinion seems to be that short of live sex acts we can transmit
anything. And they're not too sure about the live sex acts. :-)

Proxim is a supplier of 902-928 MHz spread spectrum transceivers.
They are available in two different power levels (100 mw and 1 w)
and do not require licenses to operate (under Part 15 of the FCC rules).
They are capable of data rates in the 200kbps range. Proxim is located
in Mountain View, CA.

  I write Packet Panorama in Practical Wireless, a column devoted, obviously,
entirely to packet radio. I am instigating a monthly item called "Sysops
Corner". This will be a photograph of the sysop, in the shack, preferably
together with information on what the sysop does, i.e. BBS, Node, Remote Sysop
or combination of all three, plus details of equipment and antennas used and
the interests held.
  I can read both 3.5 and 5.25 standard/HD disks and would be prepared to
return disks and photographs after use. My address is as follows:

Roger J. Cooke, G3LDI,
The Old Nursery,
The Drift,
Swardeston,
Norwich,
Norfolk,
England, NR14 8LQ.   Tel: 0508 70278 (daytime answering machine)
  I would also be interested in any packet groups, clubs or organisations
that may be in existance. Please send any details you may have.

Hello MacUsers,

Harald Koch asked in his message of Dec 91 about Macintosh Ham Software.

Well I'm glad to say that at least here in Europe things seem to be getting
a little better day by day. To begin with, Mac's were prohibitively expensive
here, but with the introduction of the Mac Classic this seems to be changing.

Anyway here is a list of some of the Ham software that I have seen running on a
Mac.

1. NET/MAC, TCP/IP for the Mac.
2. AEA MacRatt, controler for the AEA PKP232, excellent.
3. GrayLineMac, grayline stack.
4. TalkTerm, talking terminal for use with DX clusters.
5. Broadcast, for use with PACSAT'S.
6. KISS_TLM, for use with OSCAR 13.
7. MacShortwave, propagation predictor.
8. IM/Mac, better mailer for use with NET/MAC
9. Morse, morse code tutor.
10. Various Hpyer stacks, including one that I'm just about to finish

which will control TX/RX rigs that have a RS232 interface.

This is just a small sample of the stuff thats available. It's there, you just have to look hard sometimes. Another place worth looking at is the ARRL Project Mac. Ofcourse the telephone BBS's can prove useful.

If you need any more information on any of this please feel free to get in touch.

AMPR.NET g0oan%g0oan@gb3xp or BBS.NET G0OAN@GB7HSN.#32.GBR.EU.

Regards for now, Sean.

Actually, it's "above 50 MHz", AND it applies only to "domestic
communications" (between points under the FCC's jurisdiction).

The FCC has never groked the concept of protocol layering and
modularity. That's how they can talk about "ASCII" and "AX.25" as
though they were both "protocols", and why asking them whether sending
binary computer programs is "ascii" or not is probably not a good
idea. Just do it. It doesn't matter how intricate your coding and/or
compression schemes are, if you are not DELIBERATELY taking steps to
hide the meaning of what you're sending, then as far as I'm concerned
you are not violating the no-cipher rules.

With the present rules, I agree with you, but a major proposal appears
to be in the works to relax the business prohibitions for amateur
radio. Perhaps this is our chance to see if the rules could be
changed to clearly allow automatic gateways with the Internet.

Anyone interested in these Part 15 data radios should keep "caveat
emptor" in mind. Many units are "spread spectrum" in name only, i.e.,
they spread only because the FCC requires them to and the receivers
exhibit no processing gain. This was clearly against the spirit of the
rules.

The FCC closed this loophole over a year ago but they grandfathered
the existing units for two years, I believe. Newer radios meeting the
spirit of the old rules (and the letter of the new) are starting to
appear, but they are significantly more expensive.

Also, I do not know of any Part 15 spread spectrum data radios that do
automatic power control, which I believe to be essential for any
spectrally-efficient spread spectrum system.

NNTP-Posting-Host: ucsd.edu
Originator: daemon@ucsd.edu

I recently laid my hands on a Paccom Tiny-2 with their NB-96 internal
modem. I have no paperwork on this thing (Paccom is sending it) but
I was wondering if anyone had converted one of these over to 19.2K
baud and had pulled TTL levels out of it to drive the Kantronics D4-10.

I'm currently running a Data Engine with 9600 & 19.2K modems on 2 meters
and 440 respectively, (and I really like the Data Engine by the way), but
I'd like to convert and use this Paccom G3RUH design on 19.2/440 Mhz.

Thanks for any and all help.

FOR SALE: MFJ-1278 Multi-mode TNC

Includes latest version ROM, multi grey level modem.
1200 baud modem. (Can be upgraded to 2400 baud)
Does SSTV, FAX, packet, AMTOR, RTTY, CW & Navtex.

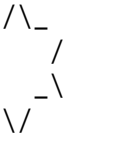
FOR SALE: MFJ-1289 MultiCom (MS-DOS software)

Allows usage of all the 1278's modes w/screen display
for video modes (FAX, SSTV, Color Packet).
(Copy protected version - no CALL encoded)

List: $279.95 (MFJ-1278)
List: $ 59.95 (MFJ-1289)

$339.90

Asking $250 plus Shipping.



Full details (on both items) can be found in the MFJ catalog. These are the current versions being sold by MFJ and as such will require no upgrades. Since I have 2 1278's (yes two) and no longer use a MS-DOS machine its time to do some shack cleaning (not to mention I -WANT- a satellite system real bad ;-).

If interested you can reply via e-mail (address below) or voice to (215) 775-8352.

Hello!

I've read about an alternative mode of the AX.25 link protocol, called DAMA
(Demand Assigned Multiple Acess). It makes use of polling to control access
to the radio channel. (like ARM-mode HDLC) The throughput should be better than
ordinary balanced mode AX.25 with CSMA, because the collision rate is drasticly
reduced.

My questions to the net is: What implementations of DAMA is available? And where
can one get them? (I've only heard about The Firmware 2.3 D)

Has anyone made experiences with this mode?

Best 73!

I am starting to do some experimenting with TCP/IP over packet. I have
a fair amount of experience with IP on the Internet and have some
questions about how it is done over packet. Routing seems to be the
real problem. Do you have to use static routes for everything? Is
net 44 subnetted? Are there future plans to get some sort of routing
protocol running?

I need some help with a problem that I have been fighting for
several days with the BAYCOM packge, if anyone is familar with it.

I can connect to most of the stations in my area, no problem,
direct, digi, BBS's, etc. However, there is one BBS that I cannot
connect to, which is the one that I want to use as my home BBS.

I was able to connect last week, but I haven't gotten into it since.

I can connect, just fine with:
    :c N0IHY-1
        (K-node), I get the "Welcome" (but I still have to learn
        about it!).

If I try the connect to the BBS:
    :c N0IHY-3
        I see his packets comming across the lower part of the
        screen just fine, but they don't get into my recieve
        buffer. I see all the retrys, and can't see any errors.
        It is a good strong signal.
            His packets start with:
                [MSYS 1.2 H$]

(umlauts turned off)
Data follows for intro to the board.
The info that I see on the screen looks the same as any
other station.

I have tried it using digipeaters, no change. As I mentioned, I can
get into all the other stations without problems (usually instant
connect.) I'm running an ICOM 245 (also tried my handheld) to
a homebrew J-pole on the roof.

I don't have the "cnot" feature enabled, to prevent a connect.
The voltage setting on the TC4305 (?) is 2.75 volts, I have tried
varying this a bit, without success.

Anyone have any other ideas?

This whole discussion of whether binary data is encrypted points out
what I think is the key reason the regulations need to be changed.
The whole concept of encrypted vs unencrypted is obsolete, as are many
of the distinctions between business and personal. (I download a
program in source form for my personal use. I really like it, so I
take it to work. Maybe that breaks the rules, maybe not. Who knows?
Who really cares?) I think regulation of content has become completely
impractical, and the FCC needs to get away from it except in the most
basic and critical forms. (No regular use for business, no sale of
communication services, no kiddie-porn over the airwaves.) There should
at least be an exemption for compression for the purpose of bandwidth
reduction using published and publicly available formats.

This really belongs on the policy topic. This is the short form of my

opinion (and only my own), so please don't point out all the holes. I
know they are there, but I don't want to type all night.

This sounds like a probable FAQ but here goes since I have not yet seen it:

I want to buy a TNC in the next few weeks and wonder if a feature
compare among the main 3 or 4 TNC vendors exists?

I'm tending towards a VHF/UHF TNC with mailbox rather than starting
with a full featured all-mode (150 buck price tag vs near 300
for an all mode being the reason).

In addition to a feature compare, would appreciate comments on what
I might be missing out on with the $150 range vhf/uhf versus going
the full all mode route.

FYI I plan on using 2M mobile and/or ht, perhaps 70cm radio also.
I also have a Kenwood 440 on HF (I wonder what kinds of things are
in the ham bands and non-ham bands that might be interesting to
listen to with an all-mode controller?)

In the computer dept, I have a dumb terminal (e.g. VT100 kind of thing)
and a primitive IBM PC with CGA monitor.

Would appreciate any and all advice... will post a summary of
all replies when the dust settles down in about a week or two
on these main questions of:
   -Feature compare/opinions of VHF/UHF/mailbox TNCs
   - "   "   ALLMODE TNCs
   -What "out of band SWLing" on HF is out there which would be
    neat if I bought an ALL MODE controller?
   -etc.
Thanks... KD9OF

There's an even bigger drop in interest when so-called Amateurs find
out they have to actually scrounge parts for a project. It's the Dick
Smith paint-by-numbers kit mentality... One bozo was actually
threatening to take the local supplier of the G3RUH 9600 bps modem kit
to Consumer Affairs, because it wasn't what he expected. That's funny
- it was advertised as being a PCB, an EPROM and a parts-list (plus
circuit) - that's precisely what was supplied to him! Said bozo also
accused me of not being a "real" Amateur (whatever that means) because
I didn't have my 10 wpm CW (whatever relevance that may have). I guess
he started "ad hominem" attacks on me because he couldn't refute my
arguments.

>The fellow who writes ARA's packet column (I've forgotten his name) keeps
>insisting that NET/ROM is illegal in Oz. Is this a result of differing
>interpretations of the regs, or has NET/ROM been modified to make it legal, or
>what?

That would be John Day VK3ZJC - he's also a director of a certain Amateur
shop in Melbourne, so may have a bias towards certain TNC's... Anyway,
NET/ROM is illegal at level 2 (where most packet activity occurs) since
the packets do not carry complete identification (they carry the ID of the

local NET/ROM node instead). It is however allowable at level 3 (the network layer) and is commonly employed there. Rumours abound that the DoTC are turning a blind eye to its use at level 2, with a view to the eventual de-regulation of Amateur operations, but AAPRA hotly deny this (I guess they have their own hobby-horse to push i.e. ROSE...).

>Ahhh, when I see those messges from the US with their 56k backbones etc etc,
>I feel like just packing up and shifting over :-)

It's a shame, ain't it... Have a look at the wonderful LANs they've set up in VK1, and VK3 etc, and you wonder what happened to VK2 ...

I am new to packet radio. I am interested in the G3RUH (?) 9600
baud modem kit, and also knowing what radio's work with it.
I am using a PK-88 TNC.

1. What sources and prices exist for the 9600 baud modem?

2. Has anyone put together a list of 2 meter rigs that work
    with this 9600 baud packet modem?

Those of you using 9600 packet, what hardware works, and is a
low cost way to get started?

Sincerely,

Neal Pollack

Up to now I only knew about The Firmware 2.3d implementation. But I heard as a
rumour that there some guys which try to port this implementation to the
PK232. The PK232 would then probably behave like a TNC2 with The Firmware.

If there is interest I could post (or mail) the binaries of TF2.3d

>Has anyone made experiences with this mode?

Sorry not yet, as I didn't got an digipeater with DAMA facilities in my
neighborhoud. On "normal" digipeaters the TF2.3 behave as was before.

Looking for Packet Groups
Looking for Packet Groups

I'm looking to find other packet groups or organizations that would like to exchange ideas and information.

In the state of Michigan (USA), we have a recently formed group called MIPAC, Inc. (Michigan Packet Council). This group covers presently convers the entire state of Michigan. There is also an unofficial group called PTIG (Packet Technical Interest Group) that is in SouthEast Michigan.

We're still trying to even get a decent system up around the state we still don't have connectivity everyone. We have no direct routes between the East and West sides of the state (about 200-250 miles apart). Probably the best coordinated systems are the DX Clusters backbone, GLNET (comprised of TEXNET nodes) on the West side of the state, and the Detroit/Windsor TCP/IP switch/server site with it's NETROM/TCP-IP backbone to Ohio (about 60 miles).

I know that many many other people have gone through the problem of trying to set up a state or country wide system and have dealt with problems. Many also have packet groups that have solved these.

I just got hold of a paper from the NEDA (North East Digital Association) that I thought was very well done explaining a lot of terms and showing maps of the packet system. Are there any other groups out there that would like to share information also. It would be good if groups talked to each other and learn from each others mistakes and problems. The MIPAC is still new, but we are putting together a new list of stations in the state. We are also trying to decide what type of systems should be put in too.

One of my goals would be the capability of passing various protocols. Since I run several TCP/IP systems, I would rather see NOS switches go up, but that's not always practical. I have asked several times on here for any info on Flexnet, but noone responded back as to how to get hold of one of these units or who to even contact (guess we won't try that one then). I like what the people in Georgia are doing, but that might still be out of our price range.

We are still seeing about getting a post office box for MIPAC, but I can let other groups know when we do get one and what it is. I would like to get some kind of 'point-of-contact' or address though from other groups.

Whoa! There is absolutely nothing in the present rules that says you can't
compress, so why do we need an exemption? I'd like to nip this one in the
bud before people really start believing that compression is illegal...

Phil,

Yes, at present static routing is pretty much the default (pun). There
has been some experimentation with SPF protocols (RSPF) but it's not
really ready for prime time. NOS also includes RIP, but except for very
limited situations it's not really suitable for radio.

Network 44 is subnetted by geographic area. At present most subnets are
isolated "islands" but an increasing number are interconnected by
encapsulating gateways that use the Internet to provide virtual links
between them.

IP routing in the amateur network is a fertile area...

A routing protocol specifically designed for packet radio, RSPF, has
been experimentally implemented. Based upon the link state - SPF model
of routing, RSPF is a small (for PC use) protocol which supports
NOS-style node groups (subnets) in both backbone and local configurations.

The existing implmentations are a bit iffy, but the N1BEE variant
on PA0GRI's NOS, available from ChowdaNet in RI (sorry, I don't have the
number handy), is pretty stable. I'm the protocol's author, and while
the current test code is based on V2.1 of the spec, Mike N1BEE is
about to work on my not-yet-released V2.2 of the protocol.

Other than that, there's TheNet and its clone ("NET/ROM"), which is
sort of an autorouting program for packet radio, and there's ROSE,
which I suspect is more static though based upon X.25.

NET/ROM uses a "distance vector" type of routing algorithm which has
serious problems on unreliable radio links. ROSE uses static routing,
but unlike the author of NOS, ROSE's authors actually tout static
routing as an "advantage" of their system.

The first rule of American marketing: if you can't deny it, emphasize

it.

Face it:

> The single problem which differentiates HAM radio networks
> from commercial networks is subtle rules which restrict
>   freedom of speech. No posibility exists for a internet-packet
>   gateway with this restriction.
>
> Unfortunatly this restriction is the only thing keeping the

HAM bands from becoming a usefull tool for me.

I see a compromise. Net news is a public access net with fewer restrictions. Specifically advertising is restricted. I would love to receive my email on packet from work. This is an acceptable Internet option not a HAM option.

Perhaps it is the recent announcement of a email service using packet radio technology in an News article I just read. I am sure it uses the stolen portion of the 220 MHZ band.

The article also said it is a first to offer email using radio Ha Ha dream on. See comp.dcom.telecom for announcement.

I do not want to order a pizza using my 2MTR HT but to me this is not a good point of view for paket radio. I will admit that much of the bands are being under utilized. What is the point of AX.25 if there is no one to colllide with.

CB has had a bad name and understandably so but I use it as it was intended. When I have to follow my girl friend to the auto service center we can talk about her lanscaping business and about my work without a problem.

Talk about useless the pile-ups on 10 meters.

The answer here is the redefinition of HAM to be personal communications not the communication to make contact rule.

I don't mean to be too pointed Dave, but your 4800bps modem and Nos node
will be on air when again did you say ? What happened was no-one did
anything ... too much bickering.. too much in-fighting .. not enough
doing ..

There is a wonderful lan is VK2, there are about 6-7 nodes running on it,
it will increase as facilities available increase, and others get themselves
organised (Mark, are you reading this ?)

I am having a problem with a Heathkit model HD-4040 Terminal Node Controller.
It works fine in all modes except digipeat mode. I have the digipeat mode
control set to ON but other stations cannot digipeat through me. If anyone has
had this problem or has any suggestions I would appreciate your help. I am using
the Heath AX.25 version 3.3 firmware.

Thanks,

de N4LBB, Perry

Please give us a review after you have played with it. I am especially interested in the performance on AMTOR. Also,
does the manual mention PACTOR ? I wonder how hard it would be to make it do it.

I beg to differ. It does depend a bit on one's definition of what a gateway
does, but I feel sure that I can(have) implement a 'gateway' that is both
very useful to me as a ham and still within the rules. Email me if you want
to discuss details or exchange opinions.

|>   I see a compromise. Net news is a public access net with

Hah! There is a lot of commercial activity there, by any definition.
Some of it is what makes the news groups worthwhile. {Sure wish ICOM & Kenwood
subscribed to this news group}.

GfxBase uses the SanaI protocol to connect to local domain and DECnet
style connections. If AmigaNOS were made SANA compliant it would be
a small job to get GfxBase's X11 to work with it.

HI -
I have seen frequent references to PACTOR. Can anyone provide a short intro as to what it is; who is using it; advantages/disadvantages; hardware requirements; user interface; and hardware interface. Anything at all will be appreciated.

Thanks in advance.

I have the following system for sale:

    Tandy Model 102, 32k ram
    Ultimate II rom (spread sheet, word processor, etc...)
    Disk drive (3.5 inch, battery powered)
    Bar Code reader (with software)
    Cassette interface

All of this stuff, including the carrying case that I have the machine in, for a measly $270. I have recently purchased a Toshiba T1000SE and find that this guy is sitting in my closet unused. It makes a great portable packet station since it has the built in com port, also has a built in 300 baud modem. And with the disk drive there is a lot more storage available.

This setup would generally cost you in the neighbor hood of $600-700 to purchase. All your for only $270...

Bob,
your thought of porting packet bbs bulletins to a usenet group
and vice-versa sounds interesting. OTOH, the last time I was on
packet, there were a lot of discussions going on about what
traffic was appropriate to be sent "ALLUS"....too much junk
many people complained!

Steve,
under U.S. regulations (don't know about Canada), it is "questionable"
if you use ham radio to circumvent toll charges, even if the traffic
is non-commercial.

As for the speed of packet, your information is somewhat correct (1200
baud), but overly optimistic. #1) it's a half duplex circuit with
turnaround delays; 2) since others may be sharing the same channel,
there are collision, retransmissions, etc. On a GOOD 5-10 mile
connection, good throughput is closer to 100 baud or less. For
longer vhf distances, multiple hops are required and it is abysmally
slow. ONLY A COMPUTER HAS THE PATIENCE TO PUT UP WITH PACKET SPEED
OVER ANY DISTANCE! (Yes, there are a few areas which have higher
speed trunks.) For really long distance (50-500 miles), actual
throughput is probably closer to 10 baud or less. Yes, I can send

morse code faster than hf packet! (OTOH, the computer doesn't mind,
it has much patience!)

Who, Me???? :-)

I'm getting there... Once my modem board arrives, and I figure out where to
connect it to the rig, I'll be there (I've already got nos installed and running,
oops, but there's not much IP stuff happening at 1200 (my current top speed.)

I'll admit I was a bit slack getting the modem, but I haven't lost interest.

At the moment DoTC IS turning a blind eye towards NET/ROM, IP
routing, BBSs and numerous other "transgressions". The Wireless
Institute of Australia is hard at work on a "deregulation"
proposal to be put to DoTC and when it lands there's going to be
a monumental shakeup. :-) DoTC is fully aware of what is
happening though.

>>Ahhh, when I see those messges from the US with their 56k backbones etc etc,
>>I feel like just packing up and shifting over :-)

> It's a shame, ain't it... Have a look at the wonderful LANs they've set
> up in VK1, and VK3 etc, and you wonder what happened to VK2 ...

VK1 isn't that great and VK3s is rather slow. I can give an
"expose" if you like. :-)

Carl.

Ouch! Well, I have started buying the components for the 4800 modem (and
also started on the SCC port on the Microbee as well). Someone has also
thrown another 286 motherboard at me as well, with flaky tracks to be
repaired (you don't expect me to BUY pc-clown bits, do you?). But yes,
too much talking and not enough doing...

>There is a wonderful lan is VK2, there are about 6-7 nodes running on it,

Perhaps it could be better publicised, if you want more people to join you.

>

Until recently (ie a few weeks ago), my software was only available directly
from me or one of my distributors in Denmark or Italy. I have now yielded to
pressure, and the software is now available on a few of the amateur radio
related telephone BBSs in Europe. However, it's not yet available anywhere
else. I may send it in to SIMTEL fairly soon. Is there anywhere else I
should consider putting it (bearing in mind that I haven't got FTP access
out of the country :-( )?

By the way, is the T type message still used in the USA (or anywhere else)?
It's not used in Europe, so my software doesn't support it. If there is an
interest in using my software over there, and T messages are needed, then I
will have to look at making some changes.

Hi

Is there a bridge between packet radio and internet? Or, is it impossible
to send e-mail to and from packet radio?

The reason I'm asking is that I'm going sailing from Houston to Spain and back
later this year on a friend's boat. He has a Ham license and a radio on board.
We will have a laptop computer to capture weather fax and can use it for

packet radio. It would be nice to be able to send email to some friends
if it were possible to bridge between packet radio and internet.

Does anyone out there know if there is or isn't a bridge between the two?

Thanks

Craig,

I'm definitely not an expert in packet (in fact, I'm quite ignorant

about how mail gets shuttled around, but I'm trying to learn more),
but I have a friend that I have successfully passed mail back and
forth with from his packet BBS to me on Internet. The gateway we're
using is the w2xo.pgh.pa.us node. If I mail to "bbs" at that node, and
make sure I have a packet routing header line at the beginning of my
message (he gave me the line to include, so I don't know much about
the syntax), it works fine. My suggestion would be to contact the
Sysop at that node and see what you can find out, or perhaps someone
else with more info can jump in and help. I just wanted to let you
know that such a gateway exists and maybe to point you in the
direction of more info.

Rex (KD4ALU)

|>
I am not a ham. I have considered becoming one. My primary interests would
be straight key and packet. However, my primary usage of packet would be
to access internet and to "work from home".

My home is about 45 miles from my employer. The distance requires a toll phone
call using my modem to access my employer's computer. I am under the belief
that if I were a HAM, I could use packet for advancing myself and the
community (reading netnews, sharing problem/solutions with peers, etc), but I
couldn't do work-related "homework" over the air.

Some questions:

1. Is the comment I made above concerning "homework" and FCC don't mix true.
2. Whether I become a HAM or not, could I not use spread spectrum gear to do
   my "homework".
3. Are the power limits for spread spectrum for a non-HAM inadequate for
   ~35 mile line of site in the flats of Texas (near Dallas).
4. Cost for two radios?

Any pointers/suggestions welcome.

You probably don't know about GMRS, on UHF. This is the General Mobile Radio Service. It licensed rather like the commercial services, except that only individuals are allowed to hold licenses and certains kinds of communications are not allowed (i.e. no base to base chatter, etc.). It is intended for personal communications.

This is not a new service; back in the midst of the CB craze, magazines would publish articles about the "other" CB service. The reason GMRS has not degenerated into what CB has become is, IMHO, the equipment is more expensive and the users more "professional".

Rather than trying to change amateur radio into another form of GMRS, investigate GMRS first. Unfortunately, packet is not allowed on GMRS. However, you may be able to successfully establish a packet link using commercial frequencies, after getting your form 574 approved by the FCC.

If commercial service is what you want, pursue commercial service rather than trying to take an experimental service such as amateur radio and getting it turned into simply a personal communications service.

Let's not forget those (like me :-) who don't use PCs on the air. My UNIX machine uses KISS to talk to a pair of TNCs not because its so great or because I especially like KISS, but because I don't have a PC bus to plug these wonderful cards into, and I don't think I want to re-write much of NOS into the UNIX kernel so it can speak AX25.

I could sure use some extensions to KISS. I'd be delighted to participate in discussions of the KISS++ protocol -- so how do we start?

I may have missed seeing mention of this, but in my view, one absolutely
essential feature of a new KISS protocol is one that allows the computer
to interrogate the TNC to ask it how many unsent packets its (the TNC) got.
The computer has no way of telling if the channel is blocked and will
keep sending retry packets to the TNC at each timeout.

Can some one give me the latest info on this new card

it has 1 1200 baud modem on it and 1 9600 non g3ruh modem ?
i have been told it can use normal bandwidth of a fm radio in the same
way as the 1200 baud modems can..
any more info on this new drsi card please..
also whats the cost of it ?

One thing that could be added to KISS without changing the spec (much)
and without breaking anything (I think) is to collapse duplicate
packets. When a new packet arrives via KISS to be transmitted check to
see if it there is an identical one queued for transmission and dispose
of it if so. Do this by calculating a CRC of each incoming frame and
comparing it with stored CRCs of frames already in the queue.

This would handle the situation where some heavy traffic appears and
multiple retries are queued before being transmitted. TCP takes a few
such occurrances to adjust and stupid, non-adaptive AX.25 software
never backs off. With standard KISS what happens is that two or more
copies of the same packet are transmitted when the channel goes clear.
But in TCP or AX.25 there is no point in resending a packet if it hasn't
been transmitted yet.

There is also a pathological degradation that occurs in AX.25 when the
the retry time is short and the packets are long. The channel gets
busy and several retries stack up. The total time required to transmit
the queue is so long that more retries arrive and are added to the
queue. A dozen or more retries may be transmitted and tie up the
channel uselessly. Then the receiving station has to transmit a dozen
rejects further uselessly clogging the channel and making the problem
even worse.

It is surprising how often I see this phenomenon on our channel. The
only "solution" to the problem with standard KISS is an ad hoc
adjustment of the retry time to much longer periods than would

otherwise be necessary. Of course, changes to AX.25 such as Phil's can
reduce this problem but that doesn't help the users of other software.

Simply tossing the retries under these conditions would not bother
TCP or anything else I can think of. So why not?

I would like to redirect public efforts away from a redesign of the
excellent existing modem and towards the final needed piece to make
56 kb a widespread success. That item is a simple no-tune transverter
that can follow the modem and can be built by digital folks with limited
test equipment. That appears to be a better immediate course of action
than redesigning what is already a sound product. We've been depending
on the Microwave Modules transverters, and they are often in short supply.
What is needed is a simple transverter that can take 1 mw of 29 Mhz
energy and translate it to 10 watts at 433 Mhz, or 222 Mhz, though the
bandplan isn't very favorable to 56 kb at 222 Mhz since the UPS grab.
The Down East Microwave design for 902 Mhz is already suitable, but we
have lots of existing activity on 433 Mhz with which we would like to
remain compatible. We'd like a board along the lines of the production
RF board. It should be easily dividable into receive and transmit
sections for split site use, and it should be the same form factor as
the RF board for packaging reasons. It should have short TR delay on the
order of 1 ms. Anybody with good ideas in this area is welcome to give it
a shot. And if you are interested, let me know.

I would like to second Gary's suggestion: we desparately need a
simple transverter design to get DSY modems up onto 70cm. I've been
looking around for a year now, and there just doesn't seem to be anything
out there compatible with a `beer budget' experimenter's means.

regards,
Ross VE6PDQ

Well, you don't REALLY need linear conversion if you are willing to give up
a little bandwidth and go to a constant amplitude waveform. You can use FM
gear. The DSY compatible waveform exists.

Simple and cheap transverters exist but they all have 144 Mhz IF.
See the ads from DownEast microwave, etc.

If anything redesign is done to the DSY board, the IF should be moved
to 2M.

That doesn't save a lot of money though. The hard parts are the LO chain
and the receiver noise figure. MMICs and a brick can handle the signal
path with no tweaking and low cost. Getting a stable, clean LO with minimum
tweaking, and a good receive noise figure without tweaking are the hardest
parts.

A simple to build design using "hardware store" ALUMINUM parts is shown in
(can't remember which) either the 1992 Handbook (in the satellite section) or
the Satellite Experimenters Handbook (both available from ARRL).

I'm planning on putting one together this weekend, will post results.

I'll "third" the suggestion with a slight modification... a 1296 MHz
transverter with 'DSY compatible IF (ie, 29 MHz) would also be very
attractive. Here in Minneapolis the top data rate is 9600 bps and
we'd obviously like to go faster. We also have very little
activity on 1296. A means for running 56Kbps on 1296 MHz would be
very desireable.

You can kludge it now by using a Hamtronics XV2 and a receive converter
to put the DSY on 2 meters then using a SSB Electronics transverter from
there. Just leave the transmit converter and receive converter running
all the time, it's not even too expensive. The SSB Electronics transverter
is another issue. IT's EXPENSIVE, and it must be modified to work properly.
As it comes out of the box, the IF side is TR switched and the antenna
side is separate. This is exactly backwards of what you want. You must
split the inputs, simple, and build a TR for the outputs, not so simple.
Or you can leave the output split and run two beams with preamps and
power amps mounted at the antennas. That's a real good way to go.

Using the XV2 and receive converter trick works with most of the higher
frequency transverters that want a 2 meter input. Hamtronics has a winner
here. The XV4 and converter will put you directly on 433, but the performance
isn't up to par with the Microwave Modules units. Lots cheaper though.

Question from a new ham (actually still in the process of getting my papers).
I have had opposite advice from present hams concerning the type of wire to use

of antennas. One person suggested using copper "ground" wire (about 1/4" think--I don't know the gauge), while a second person said that the smaller the wire the better. Any difinitive answers out there? I'd like to build a half-wave dipole and could use some help.

The Kantronics KPC-2400 also has a similar limitation.

>
>Any takers?
>   - Brian

We've discussed several changes to the basic design from time to time,
but those common old parts are easy to find and replacing debugged
board designs is costly. The three adjustments on the transmit encoder
allow you to compensate for a multitude of sins of component tolerances
in the entire transmit chain. It does require a simple AF grade scope
to get them set right, but you only have to do it once. A gate array
could reduce the parts count on the encoder by 2, or an ASIC could
reduce the count by 4, but puts you in a single source situation for
field replacement parts. Gate arrays wouldn't help on the decoder or
RF boards.

THE FOLLOWING IS MY PERSONAL OPINION ONLY, AND DOESN'T REFLECT OFFICAL
GRAPES POSITIONS.

A couple of changes that would be worthwhile (IMHO) would be to use a newer DAC chip that includes the latch and output amp, and go to Minicicuits type diode ring balanced modulators so the output could be on-channel instead of at 29 Mhz. This would eliminate the need for a costly external transmit converter, though at the cost of additional buffer stages and a power brick. This would require slightly different RF boards for each band. That reduces the universal appeal of the modem somewhat, but with the problem of locating suitable transverters being what it is, I think it's a good idea.

The major drawback to eliminating the 455 khz stage in receive is the necessity for a band filter with the proper group delay. This was a major stumbling block in the original design. By good fortune, it was possible to design a filter with the desired characteristics at 455 khz with off the shelf parts. Tektronix is showing an integrated filter with the proper characteristics at 10.7 Mhz, but the order quantities required are unreasonable for us and being stuck with a single source part is another consideration. If a good, readily available, filter design comes along, then eliminating the 455 khz stage is feasible. Staying with the theme of on-channel operation, the first mixer could be changed to operate at channel frequency and a helically filtered preamp, like the nice Hamtronics units, could form the front end. Single conversion to 10.7 Mhz from UHF would be prone to image problems though.

Changing the boards to surface mount, and constructing a motherboard to eliminate the harness and house an on board power supply would simplify packaging problems and reduce the size of the modem. The modular nature of the original design was deliberate, however. It allows for wide flexibility in operations. The transmit and receive chains can be totally separated for split site or crossband usage. The original choice of 29 Mhz for the modem input and output pushed the more difficult RF circuitry onto an external transverter and allowed one modem design to be used on any band for which a transverter was available. With the advent of MMIC UHF amplifiers and packaged mixers, and with the decline in availability of cheap transverters, integrating the on-channel electronics into the RF board begins to look attractive. But we don't want to destroy the modular nature of the unit completely, so some duplication of circuitry is inevitable. We also have to keep in mind the grade of test equipment available to people putting the kits together. Today, only a modest performance scope is required. If we start putting UHF circuitry on the modem, access to a spectrum analyser would become necessary, or at least desirable.

and louie@sayshell.umd.edu (Louis A. Mamakos) sez:
>Why?
>
>A real transport protocol will perform an exponential backoff as it
>begins to perform retransmissions. Won't the lack of an ACK do the
>same thing as having the TNC tell you it can't transmit the packet?
>What will you do differently?

Well, this issue is a bit clouded. The TNC may, due to channel usage, not transmit the packet for a long period of time. The software talking to the TNC does not know if it has not received a ACK because it failed to transmit yet or if the message failed to propogate. If it failed to transmit, it is far better to wait. If it failed because of some other reason on the air, then of course you want a retransmission.

On a busy channel, where your packet may be held for an extended period of time in the TNC, the link may be dropped, when in fact a bit of patience is called for. One could argue that it is a bad link (slow). But I think a timer makes more sense if it starts once the packet is on the air, rather than when it got to the TNC.

Subject: What am I missing for PACSAT work ?
To: packet-radio@ucsd.edu

I'm very interested in getting started with 9600 baud packet via the
PACSATS. If I'm not mistaken, this can be done with an FM uplink on both UHF
and VHF and non-directional antennas. I thought about purchasing the Kenwood
241/441 pair for local FM work and I need to know if these xcvrs will work
for PACSAT use ? Also - need feedback on what 9600 baud modem is best suitable
with an AEA PK-232 (G3RUH, Pac-comm, MFJ, TAPR, etc.)
Any comments/sugjestions are welcome.
Thanks es 73,
Rich

Subject : Dial-up SLIP

Hi Merry Xmas,

I am trying to use my 2400 baud modem to contact my university,

I have nos kit installed

I have an IP address, and gateway address supplied by my systems admin.

my pc is a 80386-80387, 25 Mhz, 2 Mbytes RAM, modem connected on com2.

I have been trying to use your syntax in the article of
----------cut here---
Article 2943 of rec.ham-radio.packet:

Ok, here's some fixed text for that section, sorry for the delay, but I've had
a few unexpected time-consumers the last week or two.

SLIP Modem Dialing

An extension to the attach command allows the syntax:

   attach <hw type> <I/O address> <vector> <mode> <label> <bufsiz> <mtu>
          [<speed>] [[optional '-' for debug] <send> <expect> <send> [...]]

---
with no success

could some knd sole e-mail me pls a sample attach command that I could use,
and where do I plug in my university phone number,

or is what i am doing is wrong, and I am missing some thing,

thanks a lot in advance,
ahmed

I have uploaded to the /bbs/aa4re directory on tomcat the
MESSAGES.BBA file I use to provide some pretty colours for my
users.

It's a small file (~3k) and is installed as an alternate language
in the parms.bb file.

To use it your users will have to have a terminal program that supports
ANSI colour. Most telephone comms packages designed to talk
to telephone BBSs do now and so does NOS if you have an ANSI driver
(ANSI.SYS) loaded.

Have a play.

Carl.

This was one of the first things that came to mind... and I've discussed
it with several others here on the net. One of the concerns that was
raised was whether or not there would be too much drift between all of
the converter oscillators to keep the 'DSY happily on frequency...?

I'm sure it helps to keep the 10m<->2m converters running all of the
time... but what amount of drift could be expected with this setup
and can the 'DSY tolerate it ?

Perhaps you've proven that it works, Gary... what 1296 transverter
did you use before/after the Hamtronics 2m converters ?

I am just starting to use ka9q net, and I got it working between my xt
and my 386. Works great and really loaded with features.

I just downloaded the newest version 1218 from simtel, but it does not
contan any manuals. The manuals are normaly in a file called
man-9112.zip, but they don't have it. Are they out yet, or is there
somebody that can explain some new features to me.

I want to know what the tip server can do. What happens if you do
start tip <iface>. and can I access that remotely.
What I want to do is have a dialout modem on my server and have 2
computers conected to it being able to talk to the modem.

>Simply tossing the retries under these conditions would not bother
>TCP or anything else I can think of. So why not?

It wouldn't bother TCP, but it wouldn't help things, either. Retransmits at the TCP layer still get new IP ID's at the IP layer, and so aren't identical to earlier transmissions of the same segment even though they contain the same data.

If I can throw my hat into the ring, I don't see why the TNC (acting as the data link layer agent here) needs to provide any feedback to higher layers in the protocol stack about the length of its queue, or try to "second-guess" the higher layers in any way. In the bad old days of the Internet, routers used to return "source quench" messages when their queues were near full, which was supposed to tell the sender to slow down. It turned out to be an inferior mechanism for congestion control.

A much better method is for the entity that is generating the packets themselves, the layer 4 protocol, to watch what is going on with the acknowledgements it is receiving vs the data it is sending out. The network has a finite capacity of packets, measured by the sum of all available queue space in all routers/TNC's/whatever on the net. The real way to avoid overflowing the outbound queue is to not inject packets on the network faster than they are being removed (i.e., acknowledged), and to do something clever with adaptive transmission rates and window sizes to accommodate the load on the network.

Of course, if you don't have a layer 4 protocol, you must be doing connection-oriented AX.25, which means you aren't doing networking, you're just doing point-to-point communication on a shared channel, in which case you should run your TNC in normal mode, let it figure out how to access the channel, and leave it at that. The TNC is then talking to you as a serial modem, and should tell you about a full-queue situation by control-S-ing you or dropping CTS.

As I recall, there was an effort a few years back to get the original documents in tex/troff/ascii from the authors and archive the files online (there are some residual bits ucsd.edu). Nothing much came of it.

I would, however, like to see the ARRL continue to keep past works in stock for a reasonable period of time, eg 10 yrs. If ARRL does choose to let their stock lapse it would be a service to the amateur community to allow the "expired works" to be scanned and disseminated, rather than just sitting on the copyright.

Any ARRL folk out there listening?

The DSY modem can track frequency errors of plus and minus 5 khz
with no increase in error rate. Beyond that, the signal goes outside
the IF filter edges and error rate increases. Keeping a signal inside

a 10 khz window at 1296 without AFC should be rather easy. I used
the SSB Electronics transverter in my tests. Inside, keeping it on
frequency was not difficult after a warm up period. Using it on
a mountaintop year round would probably require some form of AFC. I
didn't attempt that. My Down East Microwave 902 transverter drifts
around a lot, I haven't solved that problem yet.

We're talking a 4 PPM frequency error and that should be simple, but
it isn't always. Adding little slip on crystal ovens *should* fix most
problems. I recently got a dozen of these little fellows, but haven't
had a chance to try them out yet. Between building a new 2000 square
foot shop, fixing dead test equipment, and keeping a voice repeater
running, I haven't had much time to play.

Hmm, yes I read the copyright, I was hoping that the authors retained
copyright and therefore could distribute them to their liking, a bit
naive I guess ?

It would be a shame for the texts to become unavailable, having re-read
the ones that I have, they are a great source of information that is
mostly taken for granted as a result of the authors efforts being accepted.
It easy to forget (or not ever find out) the research involved with
the development of the numerous technologies.

Thanks Brian also, I will take a look at 'louie' today.

  Terry

I merged the papers on louie.udel.edu with those on ucsd.edu.

The ARRL conference papers on ucsd.edu are available by anonymous FTP.
They're in directory /hamradio/packet/arrl, with subdirectories by
year. Most of my own papers are there, as are many others contributed
by AMPRNET (TCP/IP) folks. When I get a chance, I'll go through some
of my archive tapes, pull out my remaining papers and put them up on
ucsd.edu as well.

At present, all of the CNC proceedings are in print. The first four
are in a single volume, the remaining ones are in individual volumes.

Because we don't pay authors for the material in the proceedings (this
includes all of the proceedings, e.g., Central States VHF Conference,
as well as CNCs) the authors retain the right to use the material
elsewhere. Including, naturally, making it available on Internet.
So if you have the author's permission, you can sure post the paper
for FTP access.

ARRL doesn't make any money on these things. We just about break even,
which is all we really want to do. The idea is to provide a medium for
technical dialogue. But the publications are copyright so that some
unscrupulous sort can't sell knock-off copies and make us *lose*
money, thereby making it difficult to continue publishing proceedings.

     Jon, I stand corrected. I had assumed, wrongly, that since CNC 5/6
     were no longer advertised in QST, they were no longer available.
     Any chance you can do anything about getting Microwave 88 back
     into print, though? :-)

Even with such goals, it would be useful to make provisions for getting out of print proceedings (eg Microwave 88, in my case) into the hands of those that want them. Maybe selling off rights to "out of print" works to a microfilm or CD-ROM service is an acceptable compromise.

Since I can't seem to get mail directly to Gary Coffman, I'll post a
question here that I <know> he could answer:

Our group is desparately looking for the souped-up KISS code that GRAPES
put together for TNC-2s and the DSY modem, together with the necessary
hardware mods. We want to try the same idea with the Kantronics D4-10
radios.

What do I need to do to get a disk with the code (image?) and the
hardware modes?

A very cheap Xtal oven is a PTC disk. In Europe we use mostly PTC disk's
from Siemens which are directly conected to the 12V. At startup they
take about 0.5Amp and this goes down after warmup. The trick to
solder the PTC fast to the Xtal, oterwhise you break the PTC disk.
(Broken PTC disk work also OK :-)
Sorry, I havn't the type number. I must lookup it at home.

This is the list from G3RUH users. There are big differences about the
performance at 9600 baud! The most of the direct pll phase modulator
radios are not very good at transmit. The problem is the phaseloop.
Current a group of oscar14 users are working on modifying phase modulated
pll radios. G3RUH has made a writeup about the phase modulator in
pll radio.
Best is an all-mode set. The most aren't using a phase modulator for FM.
But not all almode sets are good at 9600baud. (The FT736 9600 baud
receive results aren't very good.)

People interested in applying spread spectrum techniques to packet
might check out IEEE Communications Magazine for Nov 1991. There is
a useful article titled "Broadband CDMA for Personal Communications
Systems", in which some practical data on multipath is presented,
including some measurements in New York City (with non LOS paths!!).

In the same issue, there is a nice summary article "Mobile Radio:
An Overview".

Enjoy,

1) Start with those that use "true" FM (F3E), not phase modulation (PM - G3E).
2) Remember that PLL's don't like being told to change frequency.

Old all-mode rigs are good. Even older xtal-locked rigs are better still.
I just don't understand why the black-box manufacturers persist in peddling
things that won't work on high-speed packet... Notice how the "new breed"
of rigs are supposedly suitable for packet, yet are phase-modulated?

Subject: WANTED - PC7300 HAM SOFTWARE - HAVE

     Recently acquired PC7300 for Club Station W1FW a.k.a.
W1 (FUZZY WUZZY) especially on Field Day and contests.
Want PC7300 based KPC-2 KAM et al software for controlling
TNC. Also have tranlated version(s) of W3IWI's Basic Orbital
Tracking Program, which has been translated into Pascal(TURBO),
Pascal(REGULAR) and my favorite, 'C' ORBIT.C. We would like to
attempt a file tansfer from W1FW via TCP/IP network we have running
on a PC7300 at 145.51 Mhz. We are using this Freq. for proving-in recently
obtained software. Also have pipad.c tpad.c programs (hpl to 'C').
We can always use E-mail of course. 73's Bill AE1D (AE1D @ KA1PEP).

No, not really. You might check with the North Texas Microwave Society.
My understanding is that we often give the remaining copies of the
proceedings to the organization that sponsored the conference after a
couple of years.

I really don't think anyone would object to making these publications
available electronically once they are out of print. My guess is that
anyine wanting to make them available for free could get permission
merely by asking for it (in writing).

>   Even with such goals, it would be useful to make provisions for

Seems nlikely there is enough potential readership to interest such a
service in this material, but I'm sure the publications folks here at
HQ would be happy to discuss it with anyone interested in doing it.

I'm trying to use the ka9q (or is it NOS) software to drive a
hame made (Baycomm) modem. I think that RTS should be asserted
to switch the radio into transmit. However the software only
turns it on when initially run and then off again at exit.
The source code seems not to contain statements to turn RTS
on and off at the appropriate moments.

The code seems relatively straightforward to modify. However, I'd
rather get it right first time instead of inconveniencing fellow
users of the Mellifluous Ether.

Does anyone have a mod for the appropriate file to fix this
problem?

thanks in advance

I am involved in a project to set up a digital radio link to a
university-chartered vessel operating 150-200 miles offshore. The
system will have to use commercial HF SSB gear (150 W, international
marine HF frequencies) The request I have for HAM folks is any suggestions
and/or experience with moderate (1200 baud) or higher speed TNC's
at HF frequencies. I have heard nasty rumours about complications
due to fading channels and drifting transcievers. (Presumably the
drift problem is at least minimized by using a good sythesized system)

One solution is a "Sky FAX" TNC from RACE technology in Vancouver
which uses eight parallel FSK frequencies and some pretty sexy error
detection/correction but it appears pricy (approx CDN$4800) and uses
a non-standard (non OSI) packet generation scheme. As we would like,
in the long term, to be able to support relatively seamless ftp and mail
transfers between ship-board and shore-based computers, it would be nice
if the packet scheme was standard.

As we are currently involved in what is a point to point system at this
stage, digipeaters and networks are not an issue....but who knows where
it will go from there?

Thanks in advance

Dave Hazen

I am using Red Ryder, but even MacTEP (A program written in MicroSoft Basic 1.0) will work. If you are using a Mac now as a terminal, that software will work fine. As far as TNCs go, I use a KAM, but if I were to buy another, I'd just get an MFJ 1270 or a simialr Kantronics unit.

The NOS asynch driver code was designed for use with full duplex telephone modems and KISS TNCs. It was not designed to drive half duplex modems such as Baycomm. It could certainly be modified to do so, but you'd have to add a fair bit of logic to do p-persistence timing, carrier sensing, etc. This logic already exists for the

various HDLC drivers in NOS, as they are already intended for directly driving a half duplex modem on a packet channel.

I really can't quite see the point in using a Baycom modem with NOS. It costs almost as much as The Real Thing (either a KISS TNC or a plug-in HDLC card), and it imposes substantial processing requirements on the host PC (since it has to do bit-level work on HDLC frames).

If you are so inclined, you could certainly experiment with asynchronous packet framing on the air, e.g., send SLIP-encoded packets of asynch bytes directly over the air. This would avoid the need to bit-twiddle HDLC frames, and it could take advantage of the FIFOs in your NS16550A chips if you have them. Of course, you would be incompatible with "standard" packet.

One could certainly argue that asynch is the way slow speed amateur packet radio should have gone in the early days: indeed, the main reason the TNC was invented was because most personal computers don't have built-in HDLC capability. If the channel format had been asynchronous, then only a modem (plus appropriate host software) would have been needed.

But that's all water over the dam. Now that HDLC framing is firmly established in amateur packet radio, we might as well live with it, especially since TNCs and HDLC boards are now cheap and widely available. HDLC does provide some advantages, such as the elimination of start/stop bit overhead and the ability to use synchronous modems, like the WA4DSY and K9NG modems.

I am posting this because I can not reply to you via mail.
I read an article in 73 describing uo14 9600 bauc packet satellite.
To work uo14 you need to buy a 9600 baud external modem for
your pk232. PacComm sells them, look around in qst or 73 for ads.
They were out of boards when I placed my order today. You need
the same board to do terrestial 9600 baud fm packet anyway, if there
is a high speed net in yuour area.

9600 baud packet is narrower than voice, but it doesn't like the
audio filtering circuits found in most rigs made for voice. It is
therefore necessary to make some conections inside your rig to allow
bypassing these circuits for packet. You can usually still use the rig
for voice as well (i.e. these are realy just conections not modifications).

For turnkey operation however, you might consider getting a couple of
data radios made by kam. They are crystal controlled. The 2m one has
a terrible rx I'm told, and only puts out 2W, but thats the uplink freq
and you needed to buy an amp anyway. The DVR4-10 for downlink is also
xtal, but is much better quality I'm told. I intend to buy a DVR4-10
for terrestrial packet.

I haven`t actually worked UO14 yet, or seen a demo.

good luck.

I am a Novice about to upgrade to a Tech. I am in the market for a dual-band HT, and have set my sights on the Icom-W2A.

My Question: Can the Icom-W2A be used for packet work? A bit of coax to an antenna outside my apartment, a drop-in power supply/charger, a TNC connected to the mic and earphone jacks -- is this a reasonable setup?

I have no packet experience and would like to get into packet in a low-cost manner. Putting my HT to use at home seems like a logical (to me!) fashion to start out.

Has anybody done this with the W2A?

Comments, suggestions, etc. are greatly appreciated.

73,

Tony.

I've a DJ-F1 handheld running 5 watts and an AEA Pk-88 trying to run packet. The rig goes to an external 1/4 wave groundplane up 25 feet. I can hear the world just fine, and I can transmit.

 Here's the rub- I can't seem to connect to anyone! I monitor my signal
 with another handheld and hear my signal going out, but not connect back.
 I found a friendly ham to connect with who CON'd to me. My side sent me a
 connection message, but he never got it back.

So it sounds like its a case of not being heard. Is packet really critical about the signal? I can make a repeater that is 75+ miles away on voice, but can't seem to make another packet station 10 miles away. I did compare my packets (noise) to another stations and my signal was significantly quieter.

Is there something about the Alinco I am missing. The book only mentions another Alinco for hookup and says to use a .1uF cap and 33k Resistor. Could this be my problem? The rig is a new model- not in the PK88 book.

Help! Anyone who has any advice- I would surely appreciate it. If you have Alinco hookup advice for packet- I'll take that too!

Thanks for the anticipated solutions!

Off hand, I'd suggest that you are overdeviating. Get the Alinco next to a service monitor, and get the deviation checked. I'd suggest that you keep it < 4kHz for the high tone and < 3 kHz for the low tone. DON'T make the mistake of thinking they should be the same...

Good luck,

    I have packet equipment very much like what you describe, i.e.
    an Icom IC-W2E (the Europe version), a short piece of coax and
    a GP antenna outside the window. It works very well even with
    low power.. 500 mW seems to be enough to have a contact with
    the local mailbox, though sometimes it seems to be just a bit
    too little. Taking it up to 1.5 W helps a lot.

    So, as an answer to your original question: yes, an IC-W2 can
    be used on packet.

Is anyone using an IC-2SAT HT on packet with a PK-88? I haven't been able to connect with any systems yet at 500mw through the rubber ducky. That seems normal but when I switch to high power, and the TNC sends a packet it doesn't drop the PTT. My guess is that I am getting some sort of feed back from the transmitter into the mic line. Monitoring the frequency shows it is transmitting silence.

Greetings. I have a beta TNC from TAPR, and I also have a (borrowed) Yaesu FT-203R HT. I would really like to hook these things together.

From things I have seen and heard, numerous Japanese HTs have the audio returned to the positive bus instead of the negative bus. This is bad for the TNC and for the radio if they're not hooked up right (obviously :-). Also, the FT-470 I had for a while was keyed up by putting a 1k resistor across the microphone jack.

(1) Is the FT-203R keyed in the same way? (I could probably check this.)

(2) Is the FT-203R also one of those doggone audio-returns-to-the-positive-bus things, like the FT-208?

BTW, in my TNC manual, they have a little section on hooking up an FT-208. It must have a 8-pin interface jack on it that the FT-203 doesn't have, or I could already have it hooked up.

I'm also sending a letter to TAPR asking them about this, but I
figured I might get a jump by posting... the radio has to be returned
to the school's ham club when I graduate in seven weeks, so every day
counts. :-)

Thanks in advance, and please reply by e-mail to the address below.

Me too, it works fine here, but it is important to either leave the
squelch open (if you have true DCD) or turn off the power saver. In my
case the local mailbox is 100m away, so low power is enough. Connecting it
up to the beam on 70cms gave surprisingly good results with the 2 W output
(7.2 V battery pack).

Now I need a way of getting it to do dual band packet.....

There is quite alot of 1200 baud packet around 28.195 mhz. I have used it,
and it seems to work ok.

You might want to check AMTOR (Called SITOR in the maritime mobile service).
It is not even close to the speed you are looking for, but it is a
very reliable communications mode for HF.

could you elaborate on this? a couple of years ago I was lent (and still have)
a tnc-1. I connected it to my 2at and could monitor some folks but could
not connect. I took it to a friendly packet type with a service monitor and
the deviation was measured as 4 khz on the high tone and 2 khz for the
low tone.   I was then told that I should have the same deviation for
both tones. I'm confused. I would like to get into packet and make use
of this TNC-1 sitting on my shelf but my experiences have been less
than favorable. any suggestions?

Thanks
--- eric

Normal FM as used by hams has a 6db per octave pre-emphasis applied;
since the higher tone used in packet is about twice the frequency of
the lower tone, you'd expect it to have about twice the deviation.

The trick is to set your radio and TNC up so that NEITHER tone is
running the radio into the clipper (modulation limiter). Since most
voice radios are set to limit around 4.5 to 5.0 kHz peak deviation, by
setting the packet tone deviation to 3.5 to 4.0 kHz, you're pretty sure
you're not clipping and squaring off the modem tones.

Personally, I've set all my mountaintops to 3.5 kHz deviation on the
high tone to allow for slop in the users receivers.

Couldn't reach you by mail, but here it is and there are more mods.
Sorry, I don't have the name of the person who contributed this Mod.
-=-

Hyperscan:

        Effect: faster memory scan rate.

        1) Go into Alt mode by pressing [F] 2 (Alt).
        2) Press the Up or Down Arrow to activate the Memory Scan.
        3) When the Scans stops on a VHF frequency on the Left Display (The
           Main Band), Hit [F] VFO.
        4) Press the Up or Down Arrow to activate the HyperScan.
        5) To Stop the Function, Press [F] Alt.

        Result: Faster scan rate.
